1. Kenwood TR-7950 battery question

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-01 17:41:33 UTC
From: Mike <1234@hotmail.com>
Message-ID: <hhBBd.117115$AL5.112000@twister.nyroc.rr.com>
Source record: 17874

Does anyone know what the voltage and/or part number is for the memory back-up battery ? I need to replace mine, but I can only see a '13' on top of the battery, and the manual is of no help either.

2. 4 Sale...

```
Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

Icom 02AT with wall wart.
Icom BC-35 plus extra Ice brick battery $ 65

Icom IC-229H 90% $ 85

All items will include manuals unless noted.

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

Shipping is NOT included on any item(s).

Replace the Lithium Battery with a Lithium coin holder.
The lithium battery is 3v.
I have done this to several 7950/30's...

FS Timewave DSP 59+ digital signal processor (aka noise filter), with manual. Version 3 firmware. Very clean working unit. $125. Free shipping to CONUS only. Paypal preferred, money orders OK.

5. VHF radios and accessories

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-01 18:22:25 UTC
From: Eric Patterson <ericp@teleport.com>
Message-ID: <BTBBd.10883$qf5.4195@newsread3.news.atl.earthlink.net>
Source record: 17878

I currently have an old FT470 HT, whose batteries do not maintain a charge anymore. Currently, I am looking at upgrading it to a newer VHF/UHF radio. Here are some of the options I am looking at:
1. Getting a new HT with at least 2 bands.
2. getting a mobile unit and converting it to a base station. I don't plan to do a lot of traveling with a unit. However, I live in an apartment where there is not much room to install an antenna. Would a telescopic antenna work on a mobile radio as well as an portable one? Because I am visually impaired, I will need to have either a keypad for setting the frequency or a talking frequency reader. Are there handheld radios with talking frequency readers? Can you recommend one with digital keypad entry for setting the frequency? Thanks in advance for any recommendations.

7. FS: Tono Theta 777 stand-alone multi-mode RTTY terminal unit TU

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-01 22:51:18 UTC
From: "wd5jbc@verizon.net" <wd5jbc@verizon.net>
Message-ID: <1104619878.155354.108530@c13g2000cwb.googlegroups.com>
Source record: 17880
Cross-posted to: rec.radio.swap, rec.radio.shortwave, rec.radio.amateur.equipment

For sale: I have a very interesting piece of equipment for transmitting
and receiving rtty, amtor, cw, and ascii digital data modes.

This is a rare Tono model Theta 777 multi-mode code converter.

What separates this TU from any other is you connect it to any 'dumb
computer terminal' to use as the I/O display!
If you have an old dumb terminal laying around collecting dust, now's
your chance to put it to good use!

The Tono is a microprocssor controlled code converter that
sends/receives data on it's rs-232 port and communicates directly with
any rs-232 terminal. The Tono is completely controlled from the
terminal, or you can run a terminal program and connect it to a pc if
you wish. The unit runs on 12vdc. You will need to supply
an AC adapter, or run it directly off your hf rigs 12Vdc supply.

The unit works flawlessly on every mode, and cosmetically in close to
new condition.
I have a couple of pictures of the unit for anyone interested. Unit
comes in its original box with manual, interface cable, and some pc
terminal software on 3 1/2 and 5 1/4 inch floppys. Again, all you need
is a dumb rs-232 terminal or a terminal program to run this unit.

Some of the specs are:

Code: Morse (continental and Japanese CW), ASCII, Baudot, JIS, ARQ
(amtor mode A, L) FEC(amtor mode B) SEL-FEC, bit inversion

Morse 5-100wpm RTTY:12-200 baud (ttl level 12-600 baud)
ARQ/FEC: 100 baud
Input: AF input/TTl input
Output: CW 80ma-200v FSK 80ma-200v afsk (600 ohms) PTT
AFSK output CW 830Hz
Rtty 1275hz(low tone), 2125hz(high tone) shift 170hz, 425hz, 850hz,
variable shift
interface rs232c, ttl level ascii code full-duplex, baudot half-duplex
Input Buffer: 768 characters
Output Buffer: 512 characters
Message Memory:
64 characters x 4 channels. 32 chars x 7 channels. 16 chars x 4
channels.
Power supply: 12VDC, 700ma

I'm asking $70.00/shipped via USPS/Priority/Insured.

Please e-mail me for pictures, or if you have any other questions.
Thanks,

Don Levstik

8. FreePlay generator question

Has anyone here ever tried to get inside a FreePlay 360? It's one of those wind-up radios from a few years ago (Y2k era). I just wanna know if all the springs are going to fly out and sever my arteries and be impossible to put back together again.

Sorry if this is the wrong place to ask, I just did a quick search for a newsgroup full of the sort of folks who might know the answer.

I ordered a replacement battery from Newark Electronics a few years ago.
They sent it to me inserted in a piece of anti-static foam. That's
right...conductive foam.
Needless to say, the battery was almost totally flat when it got to me.
They thought they
were doing me a favor. :) :)

Umm, since you have a Tech license, have you tried getting on any of
the Houston repeaters, and asking for help/Elmer-ing? When I lived in
Houston, there were quite a few fairly active repeaters there...

For tower materials of any kind or aluminum whatevers, try Texas
Towers in Dallas -- see their web site or call them.

Have a happy...

I have two Radio Shack VHF handhelds, these are the same as the Radius SP10
radio's. Only difference is the Radio Shack name on the case. All
accessories are the same.
They come with chargers, batteries and antenna's.
I also have the programming sheets.
They are dip-switch programmable.
These are in very good condition and ready to be used.
$75.00 for the pair plus shipping.
Cont US only.
USPS money orders only

Hi folks,
I need the part number of this component on a Kenwood TM-741A/E
transceiver:

push-botton switch S5 (MHz switch), located on the Display Unit.

I have the schematic diagram, but parts numbers are not listed on it.
I need this number to order this part From Kenwood (by the way, it
could be ordered from Kenwood directly on: www.kenwoodparts.com).

Many Thanks, 73s
Daniel ve2bap

I bought a vacu-formed cover for my Bencher paddles years ago at a hamfest and I've been looking for
a similar cover for my bug for years.
I rarely use the bug, so I'd like a display cover versus an operational cover for it.
I found this after a Google search
http://www.ayustar.net/cwkeysdustcovers/cover%20picture.htm
The guy's in Puerto Rice.
Couldn't find anything else close.

Congrats on the license, whenever you have completed it.

You may do better if you can attend meetings of a local radio club,
rather than an email list. There are many people with experience and
equipment for projects like putting up an antenna, and this is often
done for hams with physical limitations.

The ARRL can steer you towards a local radio club.

You order in the pizza and refreshing beverages, and I am sure you can
get some help. Houston is a litle far for me, however.

Happy trails,
Gary (net.yogi.bear)

Is it possible to run two radioshack switching supplies in parallel? I have tried it however one always seems to shut down, so i would only be getting 25 amps max. I need all the amperage I can get because I am running two car audio amplifiers in my room... Thanks for any advice or instructions!

-Matt

Did you isolate the supplies with high power diodes?? Or run each amp on
it's own power supply.

I just had two powersupplies and ran the cables together so a simple way of putting it would be that I have an amp, and i took the + from both powersupplies, and put them to the + on the amp and the same with the -. do you think it would work for me to get some bridge rectifiers from radioshack? (25 amp bridge rectifier is $3.50 or something like that,) get 2 of them and isolate each powersupply?

26. Re: two 25 amp radioshack switching supplies

All you need is 2 25amp diodes and hook up so it looks like one half of
a4 diode full wave bridge rectifier, or it looks like a 2 diode full
wave bridge rectifier. The output is positive, and the input of each
diode is the positive output from each power supply.

in + >|
\
+ out
/
in + >|

pos from power1 to diode >| output tied to second diode output
common output is positive at amp/power1 + amp/power2
pos from power2 to diode >| output tied to first diode output

I would still supply each amp separately, due to voltage requirements.

so i could buy one of those a4 rectifiers (this one?)
http://www.radioshack.com/product.asp?catalog%5Fname=CTLG&category%5Fname=CTLG%5F011%5F002%5F006%5F000&product%5Fid=276%2D1185
and then use one half for one amp, one half for the other? (I have
already opened the powersupplies up and tweaked their voltages a bit :)
(14.4 volts instead of 13.8)

No, because you would NOT get seperation of the supplies.
If you hooked up the supplies to the 2 ac legs of a 4 diode full wave
bridge, the supplies would be connected through the two doides that make
up the negitive half of the bridge, only by using 2 diodes will you get
true isolation. All you need to do is isolate the positve outputs of the
supplies, the negitive can be wired together.

> or instructions!

Why in the Multiverse would you need that much audio power in your
room?

Do you have no concern for the quality of your hearing in later
life?

<sigh> Ahh, well... You need to diode-isolate the supplies, as has
been pointed out. I would add that it may be a good idea to use Schottky
power devices as opposed to generic diodes. Schottkys have a much lower
forward voltage drop.

Run the positive lead from each supply to the anode side of one
diode. Tie the cathode side of the diodes together, and take your common
positive output from there. The ground leads may be tied together
without isolation.

Good luck. Hope your neighbors don't object to the noise.

Yes, this would be possible but not the best choice.

Check out the Astron power supplies, in particular the RS-70M.
It should provide sufficient power, is very well regulated.
Google will find them for you.

Hi,

I would have your friends check to make sure the
jumpers on J4 the ext. osc. plug are installed.
There should be a jumper between 2&3 and between 5&6.

I bought a 210X from a friend of mine and he told me
to make sure if I was going to use it on SSB to put
the jumpers in. He was using it on some digital mode
which at the momnet I can't remember.
Hope this helps.

The freqency /time display doesn't blank any of the center segments on
either time or frequency function. Any suggestions on a fix appreciated.
The serial number is 59,800 and I wonder if anyone can tell me if this is an
early or late model?
tnx

```
It's a five digit display made of seven segment digits. The center or "G"
segment doesn't blank when zero is displayed so zero looks like an eight.
It has leading zero suppression and instead of the zero being totally
suppressed the center segment appears as a minus sign.

Yes, you just need a diode in series with each power supply's output
so they are isolated from each other. Schottkey diodes are
recommended for the lower voltage drop (and less power lost).

Go to your local auto supply store and get a reverse-polarity
two-battery isolator. Tell them that you are running a
positive-ground British RV or something exotic like that. These
devices exist but they have to be ordered from the warehouse. They
consist of two horse-size diodes mounted on a heat sink with nice
big screw terminals. There should be a clear hook-up diagram with
it. This will be cheaper and easier than buying the components and
manufacturing the device yourself.

Connect one P/S to one input, and the other P/S to the other input.
Connect the load (amps) to the output/common. Warning - if one
supply has a slightly greater output voltage than the other, that
one will pick up the whole load. Digital metering of each supply's
output and the load voltage (nominally 0.7 V below the supply
voltage) is important.

That's how I run my communications center, with a big marine
gel-cell battery floating on the DC bus (13.8 V). Haven't had a
problem in five years' continuous duty.

Even with diodes, it is often the case that one supply will hog all the current while the other one loafs, as the output set points of both would never be exactly the same. The easiest way to deal with the problem is to hang a boat battery on one supply to float.

Unless you are going for the Neil Young sound, the average will be lower than the peak, allowing the battery to absorb a lot of the peak current with one supply operating quite efficiently.

It may be difficult to truly separate the two amps with their own separate supply as this may lead to ground loop problems, but if you can tie the grounds together, you might not.

Another approach would be to check out E-bay for a good clean used integrated amp.

Jim

50. FS TenTec Paragon II and Centurion Amp

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-04 02:27:31 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <canCd.13416$ph.4319@okepread01>
Source record: 17773

I have for sale an as new Paragon II Transceiver with all filter installed
and matching 961 Power Supply and 705 mic.
Also a Centurion HF Amplifier. All equipment is as close to brand new as you
are likely to find. The Paragon II has less than 100 hours use and the
Centurion has less than 10 hours use. I purchased this station from the
original owner who seldom turned it on. Details available. All original
manuals are included.
I can take digital pictures and send them to interested parties.
Price is $2995 for the complete station or will trade for a nice TenTec
Orion.
Thanks, Charlie Hugg, K5MBX

If I understand you right, it sounds like you have a shorted transistor
driving either the rows or columns of the multiplexed display.

Check the segment transistors position Q1052-Q1056 (2sa733a-q)

One of them will probably be shorted. The signals for the transistors are
coming from ic msm5524 controlling the frequency and time display.

Greetings Peter

Peter
Thanks for the tip but I had previously checked the voltages on the transistors you mention and all are B +4.44, E +4.58 and C -22.4 volts. I discounted them as being the problem because there's only five and there are seven segments. My guess is that these transistors are the individual digit drivers as there are five digits and the segments are muxed from the msm5524. If I look closely at the copy of a copy many times over of the schematic I can see where a prevoius owner made notes indicating that the center segment is driven by pin 25. Any more tips appreciated. As you can tell I'm out of my league with this kind of stuff.

This web page:

<http://www.crocuta.com/FRG7700/html/page20.html>

indicates the segments are controlled by Q1052 - Q1058 (2SA733A-Q)

So there should be seven transistors there.

If the transistor isn't identified in the schematic, you can narrow down the segment to one of two by tuning to all 1's and then all 2's. 2 segments will have the -25 voltage on them for both tests. You may be able to get a better handle on which of the two is bad by tuning to 15,555 - the segment that consistently reads the full -25 (or -22.5) is probably the bad one.

I'm not familiar with your radio - just basic trouble shooting.

I only have a bad pdf of it, so that could be the problem.

Indeed check if there are 7 of the same type of transistor there and you can try it on 2 way's. You can change them one with another or if it is a leddisplay get the suspected transistor out of it then it must go dark. If the problem is from pin 25 then check with an oscilloscoop if it's switching right, looking to another pin with the same function for another segment.

Good luck PP

I don't think your price is very good. I can get a box of 10 new ceramic insulators just like them at the local farm supply store for your price.

Paul

According to my schematic Q57 and Q58 are drivers for the 2 LEDs used in the clock mode to indicate AM or PM. Looks like I'm going to get the scope on the bench and see what happens on the various segment pins. I've not had much luck finding the data sheet on the MSM5524, anyone have any?
tnx

Nice desk mic.
In good condition.

$46 shipped CONUS

69. ICOM CM-8 battery question

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-04 23:16:25 UTC
From: Zorpetus <zorpetus@yahoo.com>
Message-ID: <1104880585.352662.211920@z14g2000cwz.googlegroups.com>
Source record: 17792

Hi,

Could anyone told me something more about Icom CM-8 battery pack, like
for example:

- voltage (is it 8.4V?)
- capacity (is it 1100 mAh?)
- what is that piece of electronic inside for?
- why it does have 13.8V AND wall charger connector. Could it be
charged both ways?
- why it does have 11 (!?) "strange" cells inside but only (nominal, if
I am right?) 8.4V
- it seems to have thermal and current protection connected in series
with cells (if somebody could confirm this?)

- does anybody, maybe, has a schematic diagram of it?

(I would like to put 7 x NiCd AA cells inside, and I am not sure if
that could be done).

Any info is more than appreciated.

Try here for a copy of the manual (looks complete, but I can't vouch for
it).
http://www.crocuta.com/FRG7700/

Cheers.

Ken

I fired up the scope and had nice patterns on MSM5524 pins 26 thru 31 about
20 volt PP but pin 25 had about 3volts PP . Later I pulled the chip and
bent pin 25 out and plugged it back and voila, no center segment, anytime.
While the chip was out I checked the pull down resistors and they're all
about 100K ohms. Pin 25 which controls the center segment appears to be the
problem. Now what I need to know is the the IC or could it be something
else?
tnx

I presume this is a new acquisition for you.

You've mentioned the previous owner had a note on the schematic
indicating pin 25 controlled that segment.

Sounds to me like he found the problem, and decided it would be easier
to sell with a segment always on than always off.

Murphy's law says since the MSM5524 is out of production and relatively
hard to find it's the most likely problem. (besides, it's the display
driver)

Here's an auction for one I found as part of an unsuccessful search for
a data sheet:

<http://search.auctions.shopping.yahoo.com/search?desc=MSM5524+&auccat=23761&st=auct&f=&apg=1&nm=1&acc=sg&alocale=0sg&sb=desc>

You may be able to find a better price.

I saw the Singapore deal but it aint worth for me. I might pay $10.00 for a good one but no more. The 7700 isn't worth that much! If I don't have any luck I'll take it to tnext hamfest and see if I can get my money back, or find a junker.

Ken
Thanks for the point. I have a schematic and have read some of the manual
and it is misleading. I
may be clueless but not as clueless as the guy who wrote them manual. I
trust the schemtic because I can follow it on the PCB. The manual is all
wrong on how the display works.

No problems, just thought a clearer version may assist. I don't recall if Yaesu had a propensity for using IC sockets (I fear not) but you should be able to pull the segment drive pins down to the reference voltage (pin 1 of the IC) using, say, a 10k resistor without causing damage. (Is the display connected via one of those fairly rigid ribbon cable connectors??). Thus you can light the segments up one by one (for all digits, obviously) to check operation. OKI made these beasts but don't even list them in the obsolete components
http://www2.okisemi.com/us/docs/PrdDisplayDocs.html#products.txt1525 but an e-mail may be rewarded.

www.1sourcecomponents.com claim to have these IC's in stock, but who knows how much. I think I'm actually looking at one right now on a VFD board from an ancient satellite dish controller (I'll confirm the part number if it becomes an issue), but as I'm here in New Zealand it may be of limited use if you can find one more local to yourself. Let me know though, I can send it over.

Cheers.

Ken

Yes, it says NiCd (Nickel-Cadmium).
It is an older battery pack for an older HT - Icom H16 (at that time
Li-ion was Science Fiction :-)

The service manual for the (Trio)Kenwood R-1000 has a lot on it.
Internal block diagram and pinout. I got the pdf from the mods.dk
site.

81. FS: Tono Theta 777 RTTY/CW/AMTOR Terminal Unit/ Price reduced!

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-05 23:19:14 UTC
From: "wd5jbc@verizon.net" <wd5jbc@verizon.net>
Message-ID: <1104967154.620851.176080@z14g2000cwz.googlegroups.com>
Source record: 17803
Cross-posted to: rec.radio.swap, rec.radio.amateur.equipment, rec.radio.shortwave

Price reduced!

I'd rather try and sell it here instead of listing it on Ebay :)
I have several photos I can e-mail if interested.

$50.00/shipped via UPS Ground. Money Order or PayPal.

This is a rare Tono model Theta 777 multi-mode code converter.

What separates this TU from any other is you can connect it to any
'dumb computer terminal' to use as the I/O display. You can also
connect it to your PC and just run a terminal program to control it.
The Tono will work off standard rs-232 levels or TTL levels, so it is
very easy to interface with other equipment.

Specs:

The Tono is a microprocssor controlled code converter that
sends/receives data on it's rs-232 port and communicates directly with
any rs-232 terminal. The Tono is completely controlled from the
terminal, or you can run a terminal program and connect it to a pc if
you wish. The unit runs on 12vdc. You will need to supply
an AC adapter, or run it directly off your hf rigs 12Vdc supply.

The unit works flawlessly on every mode, and cosmetically in close to
new condition.

I have a couple of pictures of the unit for anyone interested. Unit
comes in its original box with manual, interface cable, and some pc
terminal software on 3 1/2 and 5 1/4 inch floppys. Again, all you need
is a dumb rs-232 terminal or a PC and terminal program to run this
unit.
Some of the specs are

Code: Morse (continental and Japanese CW), ASCII, Baudot, JIS, ARQ
(amtor mode A, L) FEC(amtor mode B) SEL-FEC, bit inversion

Morse 5-100wpm RTTY:12-200 baud (ttl level 12-600 baud)
ARQ/FEC: 100 baud
Input: AF input/TTl input
Output: CW 80ma-200v FSK 80ma-200v afsk (600 ohms) PTT
AFSK output CW 830Hz
Rtty 1275hz(low tone), 2125hz(high tone) shift 170hz, 425hz, 850hz,
variable shift
interface rs232c, ttl level ascii code full-duplex, baudot half-duplex

Input Buffer: 768 characters
Output Buffer: 512 characters
Message Memory:
64 characters x 4 channels. 32 chars x 7 channels. 16 chars x 4 channels.
Power supply: 12VDC, 700ma

$50.00/shipped via UPS Ground. PayPal or Money Order.

Please e-mail me for pictures, or if you have any other questions.
Thanks for looking,

Don Levstik

82. Kenwood TM-D700A information HELP, Mermory, TNC, etc

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-06 04:49:23 UTC
From: Kevin & Natalia <sparc_man@hotmail.com>
Message-ID: <41dcbed2$1@news.iconz.co.nz>
Source record: 17804

Hi All,

I have just brought a new Kenwood TM-D700A VHF/UHF mobile transceiver, and learning what it can do.
Very nice piece of gear.

However I have found a few things in it that do not seem to be right, compared to my other Kenwood radios.
One of the main problems I have, is understanding the operation of the Memories.
Should mention at this time, I have done the mod to open the TX portion.

1. What I have done is program the first 100 memories with VHF, and second 100 with UHF.
However when I step through the memories on either band, it goes through the whole 200. So if I am on VHF, it will also show the UHF memories as well.
(The only ones the VHF won't show are those above 1Ghz, as the display won't go that high, RX only on the UHF side).
The manual does not say anything about this, or that any memory can be accessed from either band.

2. As for the TNC feature, can anyone suggest a good program to use with the built-in TNC????

If anyone can help with any information, I'd be grateful, either send it to this group, or directly to my home e-mail.
If anyone has any information on how to open the 900Mhz blocked portion on the US model, I'd like to know, this blocked area, is part of our (ZL) band plan.

Any other comments, ideas would be of interest as well.

BTW, I have checked all the mod sites on the net for the above information, without any luck.

Regards

Kevin, ZL1KFM.

Hello,

For the TM D700, I cannot help you much but for packet radio, you can either
try to use Winpack and play around with it or take a look at:

http://f4dyx.free.fr/

Michel has the command lines to use Kenwood's interal TNCs in KISS mode on
COM1 port on his home page at :

http://f4dyx.free.fr/telechar.php?change_ID=0&code_ID=3&famille_ID=Packet&rubrique_ID=Paxo
n
(in one line)

Some hams here use successfully TM D700s and TS2000s with Flex32.

Paxon: http://paxon.de/
Flex32: http://www.afthd.tu-darmstadt.de/~flexnet/
WPP: http://wpp.dc6hb.de/

and the classical: http://www.uspacket.org/

Kevin & Natalia <sparc_man@hotmail.com> wrote:

| 1. What I have done is program the first 100 memories with VHF, and
| second 100 with UHF.

Wow. Are there really that many interesting things around you? :)

Kenwood's site has a program to download that can program the memories
from your computer. Hopefully you're already using it :)

| However when I step through the memories on
| either band, it goes through the whole 200. So if I am on VHF, it
| will also show the UHF memories as well. (The only ones the VHF
| won't show are those above 1Ghz, as the display won't go that high,
| RX only on the UHF side).

There's two scanning modes -- scan all non-locked-out memories, or
scan just the local 20 memories -- 0-19,20-39,40-59,etc.

Pressing and holding MR scans all memories.

Pressing and holding the frequency dial in for a second scans only the
20 memories as I mentioned earlier.

If you're just turning the dial or hitting UP or DOWN on the keypad, I
don't think it ever limits itself to just 20 memories. Only when
scanning.

| The manual does not say anything about this, or that any memory can be
| accessed from either band.

Yes, it does. It's not entirely clear, but it _is_ there.

Any memory position can be accessed by either side, but the left side
can't go over 460 mHz or so and the right side can't go under 144 mHz
or so, so if you've got one of these frequencies in one of these
memory positions, it'll just silently skip over it. And if you're
receiving VHF on the right side, you can't listen to either VHF or UHF
(I forget which) on the left side, something like that. (I'm going
from memory here.)

It's very odd how the RX functions all work. I've ended up putting
the left side on the APRS channel, and do everything else on the right
side. This works for most things, but I can't listen to aircraft
radios (118-136 mHz, AM) on the right side. It's sort of
dissappointing, though I guess it's meant as an amateur radio
transceiver, not a scanner.

I don't know if any of this is affected by opening up the RX or TX
ranges.

| 2. As for the TNC feature, can anyone suggest a good program to use with the
| built-in TNC????

Personally I use minicom or kermit for my packet stuff, but I doubt
that's what you're looking for. :)

| If anyone can help with any information, I'd be grateful, either send it to
| this group, or directly to my home e-mail.
| If anyone has any information on how to open the 900Mhz blocked portion on
| the US model, I'd like to know, this blocked area, is part of our (ZL) band
| plan.

Got me.

Since we're talking about the D700A, another thing that dissappoints
me about the radio is the limited APRS functionality.

Sure, it can broadcast my position every X minutes. How about doing
it more often when I'm going fast, and less often when I'm slow?
(`Smart beaconing', though smart beaconing also takes into account
turning. Even the tinytrak3 can do this.)

How about a display where I can see the other hams near me, rather
than making me scroll through a list of the 30 most recently seen hams
and looking at each info page individually? Sure, I can limit what it
sees to X miles, but that's not the same.

How about telling me when a ham gets within one mile of me?

Ultimately, if you want all this stuff, you need to add a computer
running a full featured APRS program. The stuff that's built in is
very basic -- unnessesarily so, if you ask me. It's too bad that they
don't offer some of this stuff in a firmware upgrade ...

I like my D700A, don't get me wrong. But it's not perfect.

<thehixs@earthlink.net> wrote:

| After a hiatus of several years, my wife and I are getting out our
| radios and dusting them off. I have a Yaesu FT-530, and she has a
| Kenwood TH79A. They both need new batteries. After doing a web search
| today I found a lot of sources. Can someone please suggest a good,
| reputable, easy to work with company to buy my replacement batteries
| from. Any help would be greatly appreciated.

My FT-530 needed new batteries, and I just cracked open my pack and
soldered a new battery pack together. If I recall correctly, the pack
originally used 6 NiCd N cells, but I replaced it with 6 NiMH AAA
cells (the shape was different, but I made it work) and it cost me
less than $10, and has more capacity than it did before. And it even
still works with the same smart charger.

Now, there's a lot more that can be said about replacing packs like
this (about soldering, about NiCd vs. NiMH, etc. I've certainly said
a lot online about it, if you want to google for it), and if you're
afraid to do it, the battery stores can often do this for you too.
But it's something to consider when the battery pack on something runs
like $50, or you can't get a new pack at all from the manufacturer ...

103. Heathkit SB-200 Manual page missing

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-08 23:33:12 UTC
From: fmmck@aol.communicate
Message-ID: <20050108183312.06084.00001798@mb-m19.aol.com>
Source record: 17826

I found data on the Heathkit SB-200 linear amplifier on both the BAMA and mods.dk web sites, including three copies of the manual in PDF format. One version is abbreviated and the other two appear to be identical.

None of these manuals have Page 41, which would appear to contain pictorials 13, 14 and 15. The two identical copies jump from page 40 with pictorial 12, to page 42 with Initial Test and Final Assembly. The abbreviated copy contains even less.

It is possible that there were more than one generation of the manual, so I need the page between pictorial 12 and the Initial Test section. Could someone with the manual please scan the missing page and post it at alt.binaries.schematics.electronic?

I'm sure it would be appreciated by the people at BAMA and mods.dk web sites as well.

Thanks.

JK-

Thanks for the information. I'll insert your message in place of Page 41, in case I can't find a copy.

The local club is attempting to help the widow of a Silent Key to dispose of his equipment. I thought it would help the SB-200 sell if it had a manual. (I'm also considering buying it if the competition isn't too great!)

Thanks.

Ralph-

My address is garbled just a bit, "communicate" should be "com".

If you caught that, something else went wrong, or it just hasn't shown up yet. I've been having all kinds of trouble with AOL not posting messages in the AOL newsgroup, but still sending them to the outside world. I've taken to reading messages at a read-only news server and posting responses on AOL. Your message did not appear on the AOL news server but did on the news-read2.maxwell.syr.edu server.

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

Icom 02AT with wall wart.
Icom BC-35 plus extra Ice brick battery $ 65

Icom IC-229H 90% $ 85

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

114. Receive sensitivity with regard to transmitter power.... help

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-09 22:06:22 UTC
From: jetfixr <jetfixr@hotmail.com>
Message-ID: <1105308382.956827.97850@c13g2000cwb.googlegroups.com>
Source record: 17837

I recently took a test and I failed to understand how the answered was derived.. Heres the question:

A malfunctioning transmitter designed to transmit at 28 watts of power has a power output of 7 watts. In its current state, its signal is being received by a base station at 5uV. If the transmitter were to be repaired and had its proper output of 28 watts, what would the receive signal signal at the base station be?

I figured if the transmitter were repaired, that would be a improvement of 6dB on the transmit side. At the receiver I would figure the signal should be 20uV, but somehow the the correct answer was a receive signal of 10uV. I have no idea how they derived 10 uV and no explaination was given. Can someone help me out with the math here?

You probably forgot that

power db = 10 * (P1/P2)

voltage db = 20 * (V1/V2)

which is way you are off by a factor of 2.

You are over complicating things. According to ohms law, whenever you
double the voltage, (and resistance remains the same) the current
must also double so your power quadruples. For example,

10 Volts / 5 Ohms = 2 Amps Power = 10 V x 2 A = 20 Watts

20 volts / 5 Ohms = 4 Amps Power = 20 V x 4 A = 80 Watts

So taking it in reverse, if you power quadruples from 7 Watts to 28
Watts, the voltage in you example doubles from 5 uV to 10 uV.

120. Re: Receive sensitivity with regard to transmitter power.... help

From: RST Engineering <jim@rstengineering.com>
Message-ID: <10u5aaodditlq5a@corp.supernews.com>
Source record: 17843

And I fear that you UNDERcomplicated them a little. Jetfixr properly calculated, using the formula

dB = 10 log P1/P2 = 10 log 28/7 = 10 (0.60) = 6 dB

that the gain in transmitter power was 6 dB.

What he failed to calculate was the concomitant voltage gain for 6 dB. If

dB = 20 log V1/V2, then V1/V2 = 10 ^ (dB/20) = 10 ^ (0.3) = 2.0

So a 6 dB gain in power gives you a 2:1 gain in voltage.

Jim

121. advice: good, inexpensive, reliable 2m or 2m/70cm HT?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-10 16:59:09 UTC
From: mikea@mikea.ath.cx
Message-ID: <cruc8s$462$1@puck.litech.org>
Source record: 17844

My XYL passed her Tech exam last Saturday, and I passed the General. We're looking for a pair of good, inexpensive, reliable 2m or 2m/70cm HT. To us, "inexpensive" is in the under-$150 range. I would count it a bonus if the HT had a good general-coverage (say 500 KHz-and-up) receiver, and Melody would like to have one that gets NMEA-183 from her (or my) GPS and does APRS reporting. But the cost is the major driver for selection.

Thanks!

Hello everybody:

I am adjusting the LO hardware of my 2754P and there are some things that I
can not find or undestand:

After pressing shift 0 , loops calibration, overall system option the first
message is:

Connect a DVM on TP1058...etc (no problem)
(the meter shows 17mV)

Adjust frequency control
for a reading of 0.000 +/- 2mV

(problem WHICH FREQUENCY CONTROL?? OR POTENTIOMETER OR RESISTOR???)
The freuquency control board???

2.Connect a DVM on oint B of the controlled oscillator board and ground..
WHERE THE HECK IS POINT B AND WHERE IS THE CONTROLLED OSCILLATOR BOARD???

Thank you your help

Overkill for a newbee rig. You can get most of the features for about half
the money with a Yaesu FT-847. For around half of THAT you can get a nice
rig in either the Yaesu FT-100 or the Icom IC-706/II (for a bit more, you
can get the upgraded versions of these, the FT-100D or the IC-706/IIG)

I have one and like it. It is a lot of radio for the money if you want all those bands. I find the small buttons and multi function buttons a bit getting used to however. If you do not need satellite or 440 all mode, the Icom 746 Pro is a great rig. I had one a while back. They have a reputation for the transmit failing which Icom says has been fixed in later models. If you only need Hf - up to 10 meters, you can't beat the Yaesu FT 1000MP Field or Mark V which also has 200 watts that is within your budget. You could then pick up a dual band 144/440 FM mobile for the shack for under 300. --- Steve KK9ZZ

> not to troulble anyone,is this a good entry level unit ...

Entry level? No. Great rig? Yes.

What bands will you be using? All of them, or just VHF/UHF? If you are getting a Technician license, then yes, the rig is probably WAY overkill. You could still work all-modes on 6m, 2m, and 440, which is fun. And you could use the HF bands for SWL'ing. If you are going for General, then you have made a good choice. A lot of bells and whistles on it though. You could have gone with another great radio for far less money.

> a person who likes to talk skip

I would refrain from using CB-esque slang on amateur radio. Instead of "talkin' skip" perhaps you should refer to it as DX.

Dan

Or perhaps we could let people use whatever terms/slang/language they
wish on the public airwaves or public internet.
I happen to like "talkin' skip". The DX is parked in my
driveway...although I sometimes talk skip from the DX.

139. CALCULATION OF EARTH RESISTANCE IN MULTI-LAYER EARTH STRUCTURE

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-11 10:52:33 UTC
From: mmufoe2004@yahoo.com
Message-ID: <1105440753.480444.202520@f14g2000cwb.googlegroups.com>
Source record: 17662

I am PhD student and I doing some work on grounding resistance and I would like to develop a formula for CALCULATION OF EARTH RESISTANCE IN MULTI-LAYER EARTH STRUCTURE. and compare it with some field measurments...What do you think? Is it possible to develop such this formula?
Just want to remind you again that my case of study (calculation of Earth resistance for the driven rod in a horizontally stratified multi-layer earth at non-homogeneous earth).
If any body have any papers to help or any advice please do
I would like to thank you in advance
your Ram

Ts 2000 is a nice rig but it's more than the average Ham would use. One side
of the radio is only
VHF UHF. Granted it's dual receive and is the only HF rig that does it. The
847 is nice but,
it also is a small rig. 706 is basically a Mobil. All the smaller radios
like 847 -706 -ft-90 - 100
all are nice but they lack the receiver. The Ft-1000mp or the MP Field has a
great receiver
but does not have 6 meter or VHF UHF..
I would think if you want an true all mode then the TS-2000 would be what
you want.
But if you want a good receiver then the FT-1000 is what you want.

Hope we all have not confused you, or maybe helped.

Steve

Good Luck

Are you looking for something new?

Personally, what I would do is get a catalog from someplace like AES or Ham Radio Outlet, and see what's available at your specified price. Then go to eham.net and check reviews on each of these HTs to get an idea of how other hams feel about them.

For the record, I use a Yaesu VX-5R. It's outside of your specified budget, but it has served me well over the past few years and I've no complaints about it.

That's pretty much what we've been doing, along with watching eBay
and talking with local hams about their gear.

New would be nice, but the budget is the major driver here.

The Yaesu VX-5R has been recommended -- and praised -- by a number of
the folks with whom I've talked or swapped mail.

I get Monday off; we may drive down to Texas Towers and see what they
have to offer, too.

Thanks for the help, and 73s.

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

Icom 02AT with wall wart.
Icom BC-35 plus extra Ice brick battery $ 65

Icom IC-229H 90% $ 85

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have severa Scsii hard drives, and a Scsii CD changer,
and an IBM PS2 8565 for parts. No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

158. Advice on 2 Meter Mobile

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-11 20:59:03 UTC
From: jimbo <jimbo62@spamex.com>
Message-ID: <1105477143.516197.98260@c13g2000cwb.googlegroups.com>
Source record: 17681

My 10 year old Kenwood TM-241A mobile seems to have quit transmitting the PL tone, or it doesn't transmit the tone indicated. Works fine on simplex and receives OK via repeater, but I cannot get a signal through a repeater.

Anyway, it is probably not worth the cost of repair, so I am in the market for a new 2 meter mobile. Does anyone have any advice? Either good or bad experience with a current model. I have heard that the Kenwood TM-271A has had problems. Any confirmation? How about the Icom 2100H?

Thanks, jimbo

The Kenwood 261A was a nice successor to the 241 ... I owned both of them.
Never owned a 271A, but it looks a lot like the Yaesu FT-2600, which I own.
A lot of similar features I hear.

Yaesu has a nice line of mobiles ... and if you are looking at mono-band
only, look at the FT-2800M. A fine radio.

Dan

Depends on what you want to do. If you're only going for a Technician
license, you'll be limited to 6 meters and up. About your only
opportunity for "talking skip" will be 6 meters when it is open, and
that will be increasingly rare as we get lower and lower in the sun
spot cycle. If you're only going to get on the VHF/UHF FM repeaters,
just get an FM dual bander. On the other hand, if you're going for
your General license reasonably soon, the HF part of the 2000 will be
ready and waiting for you.

You could spend about half the money and get an Icom 706 or Yaesu 857;
they have about the same capabilities as the TS-2000, but perhaps not
the refinement and engineering. That might be a better way for a
beginning ham to go, but it's your money.

Most radios, especially those with a paucity of knobs and an excess of
software menus, will be complicated to work, so there's not really a
'beginner's" radio out there -- even my $100 Icom T2-H handy talky is
hell-acious-ly complicated to program and operate.

Have fun!

Bob

For a 2M only rig, the Yaesu VX-150 is in the $110-120 range regular retail. Occasional sales take it down to about $100, but I have not been following the price in detail.

Well thought of, rugged, 5W output. Very easy on the power requirements while standing by or receiving. Very clean sound and crisp reception.

I would recommend upgrading the stock antenna, getting the AA cell battery pack, and getting the RT Systems programming software and cable for it. A few other accessories may be helpful, such as a speaker mike and a carry case.

It is my primary HT for 2M for hiking and public service events, and I know a number of others quite happy with it.

The biggest grip about it is that there is no dual band version. If they made one, they would instantly sell a bunch of them.

If you want dual band in that price range, it is going to be used.

Happy trails,
Gary (net.yogi.bear)

I don't see what the problem is. Just looking in the latest AES catalog
I saw 5 or 6 HTs listed under $150, some as low as $79. Shopping around
would show even lower prices.

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

Icom 02AT with wall wart.
Icom BC-35 plus extra Ice brick battery $ 65

Icom IC-229H 90% SOLD

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have severa Scsii hard drives, and a Scsii CD changer,
and an IBM PS2 8565 for parts. No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

166. Help with Kenwood TS-820 VFO stability problem

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-12 05:40:32 UTC
From: Photoman <photoman28@hotmail.com>
Message-ID: <HeadnfpykZHQJXncRVn-iw@adelphia.com>
Source record: 17689

I just got my 820 out of retirement after at least 14 years. It has the digital display and IF output on the back but is labeled TS-820, not TS-820S and I'm not sure why... anyway when I turned it on the display came up garbage (99__.9) while using both the internal and external VFOs. Finally (after 20 minutes) the frequency appeared correct but would jump around while tuning. By the noise level I could tell that it was actually changing frequency, and not a display problem. More time passed and it seemed to be correcting itself even more but while tuning it would go from (for example) 3599 to 3700 skipping the 3600-3699 completely. I'm not sure that this was a frequency error or readout error but since the noise level did not change I am thinking it was a freq. display problem. I took off the top and bottom covers and tightened all the available screws in and around the VFO area as well as circuit boards. More time passed and finally, after maybe 2 hours everything was fine.

I then turned it off, went to a meeting and when I returned and again turned the rig on the instability started again. It wasn't as radical as before but like before it seemed to correct itself after about 45 minutes. After another 15 minutes I tuned it up and the transmitter worked fine as did the receiver.

I know this is an old radio but I love it and can load it into a barbed wire fence if I want to and it doesn't mind. I have the external VFO, station monitor, and external speaker and it has always worked flawlessly.

If anyone has a suggestion I sure would appreciate it.
73,
Ken

167. Sick DX70

I have a sick DX70 (not TH). The output power on the hf bands has gradually fallen from 100w to less than 50w over the last few months. Same effect on all bands, except for 80m, where the power has only dropped to about 80w.

I've independently verified the external power meter I use against a Bird wattmeter, and the power input is still 12v DC, so it has to be the radio.

Ideas anyone?

Is that the output into a dummy load?? I use one in the car and the power drops off rapidly above 1.5 to 1 SWR. You haven't moved the internal power switch, this reduces the output to 50W max.

>(....5. or the drivers)

I have the service manual, but unfortunately don't have an audio signal
generator or scope any more, so cannot do much in the way of testing.

My current thinking is that either the PA (or driver) is dying, or that
the thermal conductivity between the PA and heatsink has degraded
(however, the PA does not seem to run any hotter than originally, and
the fan very rarely kicks in -- again, no more so than when it was new).

>
>Aternatively send it off to Castle Electronics as they seem to know
>what they are doing -

Good tip. I'll call them today.

>they rarely quote input power in terms of Volts
>DC for example.
>

I only quoted that to eliminate the PSU from the equation. A drop from
12v to 11.5 volts can make quite a difference to the output power.

172. Yaesu FT-8000R vs. Alinco DR-605T???

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-12 12:58:11 UTC
From: W8KZW <w8kzw@hotmail.com>
Message-ID: <10ua7odbgtnkme0@corp.supernews.com>
Source record: 17695

I have both of these and plan to keep only one.

But which one?

Has anyone had experience with both? eham reviews seem to favor the Alinco, primarily because of reported reliability issues with the Yaesu ... but the Yaesu is more richly featured.

I don't want to sacrifice functionality, but I certainly don't want a radio I'll have problems with either.

Thanks in advance for your thoughts.

Jeff

Source record: 17697

Ken,
My TS-820S has a similar problem, but your symptoms are worse.
With mine, the problem is in the VFO varible cao. The grease
(conductive?) on the shaft has dried out and caused the tuning to
become intermittent. Since this is a rig I don't use much, I haven't
torn it apart, but others have and cleaning off the old grease solve
the problem. Try tuning running the VFO from one stop to another
a few times and see if the problem goes away (it does on my rig)
or gets better.

Steve W6SSP
p.s.-my recently aquired TS-520S is just starting to show the same symptoms,
oh joy!

greets all

Just wanted to let everyone [who might read this] know that I am looking to purchase a spectrum analyzer. Make and model is not terribly important. Just looking for something that works reasonably well, has fairly good input sensitivity (measurements made from an antenna are prime objective) and has a top end of at least 1Ghz.

I've looked on ebay. Most of these unit are running around $1000.00 - $1500.00. If anyone's recently purchased a new 6 or 22Ghz SA, and would like to get rid of that older one that might be sitting in the closet, I'd be interested. Thanks.

Dave

Hey all, have a VHF HT1250 for sale, limited keypad (6 buttons), with
charger and speaker/mic. 1999 manufacture.
Model AAH25KDF9AA5AN, with '99 code battery, so no guarantee on the life of
the battery, but it's working.
136-174MHz, 5watt.

128 channel, Zones, paging, all the toys you don't need!

Has a small scuff on the display, but doesn't hinder view or operation.
Excellent condition radio!

$375 plus shipping.
Will program 16ch free.

Thanks!
rb

Or to put it simply, if the voltage doubles, then the current also doubles and since power is volts x current, and 2 x 2 = 4, then the power increase is 4 x if the voltage increase is 2 x.

Hairy R. Beanz
(On second thoughts, forget that - probably never get away with it !:-)

And the really simple way to remember it:
2 times the power = 3 db.
2 times the voltage = 6 db.

I know one is a Yaesu the other is the ICOM Power Supply - that's my question, please EMAIL me directly off the newsgroup -

I know the PS-125 will work with most Kenwoods, will it work with the FT-920. I sold my ICOM rig and have purchased a FT-920 - still hasn't arrived, just wondering if it will work.

Thanks!

>- voltage (is it 8.4V?)
Yes.

>- capacity (is it 1100 mAh?)
My 1992 vintage reference says 800 mah.

>- what is that piece of electronic inside for?
It's the constant-current charge regulator for slow-charging (12-14 hr
charge rate).

>- why it does have 13.8V AND wall charger connector. Could it be
>charged both ways?
Not sure about that, the Icom wall chargers I have put out nominal
12v., or you can plug any nominal 12v source into the same jack.

>- why it does have 11 (!?) "strange" cells inside but only (nominal, if
>I am right?) 8.4V
No idea about the number of cells. If it's really an original unit, it
only has 7 cells. Maybe someone has converted it to a higher voltage
with more, smaller capacity cells? Or they're space fillers?

>- it seems to have thermal and current protection connected in series
>with cells (if somebody could confirm this?)
The pack can be fast charged with the proper drop-in charger. Since
this can generate enough heat to melt things if something goes wrong,
the thermal switch is there to open the circuit if things get too hot.

>- does anybody, maybe, has a schematic diagram of it?
Not I. It shouldn't be that hard to draw one out if you're really
interested (I haven't been!).

>(I would like to put 7 x NiCd AA cells inside, and I am not sure if
>that could be done).
If they fit it can be done :-). I'd think it would be easier to get a
pack that's designed for AA's. Icom's is BP/CM-4, a 6-cell, 7.2v pack.
There are higher voltage AA packs available from third-party vendors.

I just went to my first hamfest and I am disappointed. I bought a Alinco dr590 that the guy said worked great. WHen I got it home, everything in the display lights up, but only sqigially lines where the numbers go. Pressing all the buttons does nothing. I can not even hear static. I can power it off and on however.

What could this be and is it repairable? The radio is about 10 years old. Can I repair this myself? WHat should I do from here?

210. Millen 90651 calibration?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-15 20:23:27 UTC
From: Floyd Sense <fsense@copper.net>
Message-ID: <41e97c08_4@newsfeed.slurp.net>
Source record: 17733

Recently acquired a Millen 90651 grid dip meter in very nice condition. While checking the meter, I found the dial calibration to be off a bit more than I expected - when tuned to 10.105 MHz, the dial reads 10.7. Haven't checked the other ranges yet, but wonder what the others see as typical dial error? The manual doesn't mention the accuracy. According to the schematic, there are no adjustments internally for calibration and so I expect that adjustment of the individual coils is the only resort - correct?

Go to www.mods.dk and click on "Icom" then on "Manuals". You can
download PDF scans of the IC-207H instruction manual, and also the
workshop (service) manual.

Have you tried lowering the squelch to see if you can "hear static?" Also, the lines in question may simply be the display. ADI and Alinco radios often have this problem. It could be the display is too cold and as a result a bunch of gibberish is displayed. Also, this may occur when there is a loose connection in the display unit.

I have an ADI AR-247 that does this EVERY time I turn the unit on. A couple quick flicks with the finger on the display and it seems to straighten up.

Just some thoughts.

Why would you, an apparent ham, sell an illegal "CB linear?" You are part of the never-ending problem of illegal equipment on 11 meters spilling over onto 10 meters. I hope you buyer plugs it in and it explodes.

May be risky business. Are you not aware that anyone caught with "illegal"
equipment can lose "any" FCC licenses they may hold? Ignorance is not an
excuse and they'll expect you to know better. I'd laugh my ass off if they
come knocking on your door. You just as much as gave them your address,
giving your call sign.

Caveat emptor maximus. Many people have learned similar lessons, (self
included on some gelcell batteries). Bringing a multimeter and some
basic test gear with you might make sense.

Check the voltage on the batteries. Many displays get squirrelly when
the voltage is low.

Happy trails,

Well, I went back after posting my previous mail and everything worked. I even caught a guy on simplex 25 miles away testing it on the floor of my truck. I dont know what happened.

Does anyone know where I could get a manual for it? I could not find it on the alinco website.

Also, are these radios any good? Can they be programmed with an offset for repeater work? (The guy told me it would work on repeaters).
Thanks again for your help!

Source record: 17743

Well, I went to my first hamfest and I am now the owner of an alinco dr 590 dual band radio I wish to use as a base station. I must now decide where to locate an antenna. I have a tv town that I could mount it on but It would require about 70 feet of cable and fishing of the coax through some insulated walls upstairs. Or, I could mount the antennas to my vinyle chimney somehow and only have about a 20 foot run. But how would I get the cable inside my house? The only way I see is drillling a hole in the side of the house which I am not crazy of.

What is the best/most econmical cable to use? How would you do this installation?

Also, I dont have a power supply. I do have a deep cycle battery. Would it be improper to use this in my house as a temporary measure?

By the way this radio has two antenna inputs. I think I will use two different antennas. I am thinking of building a beam for 440 and using a j pole or ground plane for 2 meters.
I appreciate any advice you could give me!

Look here. There is a service manual and down the page is the operating
manual.

http://www.cqham.ru/sch_eng.html

You can use the battery to power it in the house if you want to. The rig
may act funny if the battery starts to get low on voltage.

I would suggest for starters, keeping the antenna location simple and the cable run short. You may not need the extra height from the TV antenna tower. Do be sure to keep the chimney mounted antenna clear from the soot that comes out the chimney.

You did not state the construction of your house, but regardless, I'd say go ahead and drill a hole through the wall.... perhaps down low near the base boards like the telco does. I stuck a piece of 1" PVC through the hole I drilled and put PVC flanges on each end to hold in place in the wall. Seal with tin foil, steel wool, etc. to keep small critters and bugs out.

For cable, I'd suggest RG8 (foam dielectric preferrably) or RG8X (smaller). Either should be fine for 2M and 440 operation. For a 20 foot run, you could even get away with RG-58. Its lossy, but probably won't be an issue on that short a run.

For a really cheap, but effective antenna, I also like to use ground plane made from brass welding rod, on a SO-239 coax connector. Standard PL-259 connector fastens right to it.

Nothing wrong with using a battery for that rig..... perhaps you have a small 12V power supply.... 1A rating or so... would keep the battery charged. Some larger 12V DC wall warts might suffice, too. Be sure you have adequate venting when using a lead acid battery though.

Good luck.

Hey...

Kinda off topic, but just FYI to everyone in this group:

TO ANYONE THAT DOES NOT HAVE A HEADSET FOR THEIR CELL PHONE

Free-Headset.org is a nationwide wireless phone safety program that provides cell phone users with a free handsfree headset to promote safe driving.

Last year Free-Headset.org provided over 33,000 people with free handsfree headsets for their cell phone.

Skeptical? Free-Headset.org has been reviewed in many big name national newspapers and magazines such as the New York Times and Popular Science.

Please help us make the roads a little safer by getting a headset for your cell phone today.

For information on obtaining a free headset for your cell phone, please visit http://www.Free-Headset.org
It's fast, easy and free! :)

Thanks,
Ryan

226. Cleaning battery corrosion on printed circuit board

I have battery leakage from a couple of AA batteries that has corroded about an inch square of surface on a printed circuit board, with the corrosion also on the little "trails" that lead from one component to another.

Any hints on removing the corrosion without damaging the board? I was thinking of trying alcohol. I also have something from Radio Shack called "Electronic Cleaner."

Thanks for any ideas.

A slushy paste of baking soda and water left on the corrosion for a few hours neutralizes the goop that the battery squirted onto the board. Rinse with distilled water and then any good contact cleaner brushed over the area.

Statistically, using your cell-phone while driving is a risk factor - using
a headset doesn't change that.

That makes no sense at all. Driving with a cup of coffee in one hand,
a cigarette in the other, putting on make-up, while yelling at the kids
in the back seat has GOTTA be safer than doing all that with a cellphone
in the other hand.

The baking-soda slurry idea is a good one if the batteries are the old carbon/zinc type which use an acidic electrolyte (corrosive as all get out, unfortunately).

Alkaline batteries have an electrolyte which is (tada!) alkaline, and using baking soda (also alkaline) won't help. Fortunately this electrolyte is rather less corrosive to metal than the acid from an old "heavy duty" battery, and it can usually be just washed off. I'd suggest warm water with perhaps a small amount of a mild surfactant (Simple Green or something like that), then the distilled-water rinse, shake dry, and perhaps use the contact-cleaner trick as a final cleaning to remove any oils present.

From taking apart other wind-up devices, you _should_ be worried about
springs popping out. The tricky part, once you find all the pieces teh
flew around the room, is getting the tension correct when you
re-assemble.

There are tricks to working with spring-driven equipment which are
best learned on something less expensive to replace.

Date: 2005-01-16 21:58:38 UTC
From: Stephan Clark <stephanclark001@hotmail.nospam.net>
Message-ID: <ifolu09ldand2uak6hilnq41pt4fcueitb@4ax.com>
Source record: 17560

greetings,

I am looking to buy a microwave frequency down converter for my spectrum analyzer.

Avcom MFC-1700 (or equivalent), to convert 1.7GHZ - 2.7GHZ (input) down to 0 - 1000MHz (output). Something close will also work.

Frequency output of down convert must be 0 - 1000MHz (range of spectrum analyzer).

Please e-mail stephanclark001@yahoo.com

Thank you.

You need to try using a hands free device while driving, that has got to be worse than just using the cell phone! Someone calls or you've got to make a call, you've got to put the @#$%! thing on, seems to be on the same order of trying to pick up several things from the floor of the back seat, or worse.
Many studies have shown that cell phones are FAR from the worst distractions while on the road, though they certainly tick people off when they see someone driving carelessly while using one.
As for only using one hand, how many hams ALREADY drive that way while on the radio and yet have no problem talking, moving frequency or adjusting something on the radio??

That'll depend what the other hand is doing. Reminds me of the joke (okay,
"everyone" knows the guys who really said this, but let's assume it's a
joke....):
Man has girlfriend in lap while driving at high speed on country highway.
Gets pulled over by angry highway patrolman who says "Shouldn't you be using
both hands?!". Hero replies "Well I would but I need one to drive."

You changed the conditions by adding in all the other factors. Anyway, go
search out the stat's, they're available somewhere. Studies in USA, Europe
and Australia all agree. I guess we're all just crappy drivers.

Is using a sound card as effective as a TNC for packet radio? I
imagine this may depend on the software, but I'm debating on which to
get. Is there any drawbacks to using a sound card?

Thanks!
Dave

I use 4 TNCs on the two packet circuits and two SITOR/AMTOR circuits
which I monitor 24/7 on a single computer. I'm not too sure that
that can be done with a single sound card.

Does that answer your question, I hope?

Depends on what you want to do.
Give us a little more information.
Do you plan to be a router in a tcp/ip network?
Do you wish to run a traditional packet BBS?
Do you want to be able to connect to your local ARES
system to send and receive messages?
Are you interested in APRS? DX Cluster? Chat modes?

My main interest is in telemetry for various projects, like high altitude balloons, rockets, etc. APRS is something I'm definately interested in, but I'd also like to include other data as well. In the past, I'd used a much simpler (and limiting) position reporting system and recorded all the flight data on an eeprom for later retrevial. I don't anticipate monitoring more than one frequency at a time, nor am I looking to break any speed barriers just yet.

Thanks for the help!

Well, that would be a cel phone I would do without. My Motorola Startac required no intervention at all to receive a call. The phone was mounted on the dash and hooked to a Motorola hands-free amplifier and visor mounted microphone. When someone called, the phone would answer automatically on the second ring. All I had to do was say, "Hello." Calling took more intervention, but with the new phones that accept voice commands, you never have to touch the phone.

>Is using a sound card as effective as a TNC for packet radio? I
>imagine this may depend on the software, but I'm debating on which to
>get.

I think you're probably right - the quality of the software is going to make the biggest difference. There's probably more spread _within_ each category (soundmodems vs. IC-based or discrete "hard" modems) than there is between categories.

One advantage to using a sound modem is that you can, in principle, run two or more modems on the same soundcard at the same time... e.g. 1200 AFSK and 9600 FSK. You can also experiment with new digital modes (e.g. PSK31, SCAMP) which either aren't supported in "hard" TNCs or which are expensive in a hardware implementation.

> Is there any drawbacks to using a sound card?

You can burn up quite a lot of CPU cycles (which adds up to power consumption and heat in your system) running the DSP software to implement a soundmodem. You'll need an operating system which can keep the soundmodem running reliably ("soft" realtime behavior) even in the face of whatever other CPU and disk I/O workload you put on your computer.

You ought to be able to put together a basic 1200 AFSK setup with either a soundmodem (kluge together an audio isolator / PTT circuit, or buy a RigBlaster or RASCAL), or with a real TNC (e.g. a TNC-2 or clone - pick up a used one for a song at a local hamfest/fleamarket) quite inexpensively.

Message-ID: <1105968835.407828.273940@f14g2000cwb.googlegroups.com>
Source record: 17574

As many of you know I am fairly new to ham and got a radio to use as a base station this weekend. It is an ALinco dr 590. The guy told me it had been modified to receive and transmit on extended frequercncies even cellular.

I do not intend or want to transmitt illegally but it would be nice to recieve the local police and aircraft if possible. When I plugged it up I could get the frequency of my local police at 452 mhz but did not have an antenna to see if I could hear anything or not. The vhf goes from 130-174 I think. The uhf displays to 500 mhz. How can I tell if this radio has been modified easily?

Also I thought cellular was 800 - 900 mhz. I could not get it to display that.

As a last note does anyone know how I can find online a free manual for htis book? I have looked but only been able to find the service manual. Thanks again!

I should be able to receive by piping the audio from my radio to the
audio input of the soundcard, right? I wouldn't need a PPT circuit or
anything else unless I wanted to transmit, correct?

Thanks again!
Dave

253. Mobile mount for HT with belt clip?

Source record: 17576

Is there a glass/vent mount without side wings that will employ the HT's belt clip?

All the generic mounts want to hold the radio with side clamps that block the power and speaker/mic jacks.

>I should be able to receive by piping the audio from my radio to the
>audio input of the soundcard, right? I wouldn't need a PPT circuit or
>anything else unless I wanted to transmit, correct?

You might be able to manage reception with a simple audio interconnect cable. The problem with this sort of arrangement is that it's fairly common for ground loops to exist between the computer and the radio (one ground through the audio cable shield, another through the power-line grounding). Ground-voltage differentials can create a current flow in the loop, which introduces hum on the audio signal, which could mess up the soundmodem's ability to decode the signal properly.

A good solution for this is to place a 1:1 audio transformer between the radio and the computer's sound-card line input. One of the miniatur "audio coupling" or "audio isolation" transformers will do the job... it looks as if you can still get these at Radio Shack (part #273-1374, $3.99) or through many electronics-surplus dealers.

Just cut the audio cable in the middle, solder one half of the cable to the "primary" winding, the other to the "secondary" winding, and box it up or pot it in epoxy or wrap it with tape or whatever you prefer. The transformer will couple the audio frequencies through, but will not allow ground-loop currents to flow.

The commercial (and better-quality homebrew) PC-to-radio interfaces usually have two of these transformers (one for receive audio, one for transmit audio) and an optoisolator for the PTT circuit.

>what about PACTOR? MFSK? G-TOR? etc?

MFSK is no problem (gMFSK software for Linux, and I'm sure there's
plenty of Windows software available). I believe that PACTOR is also
possible. The newer PACTOR modes are proprietary (or so I understand)
and I don't think there's a freely-available software implementation
yet. I believe that one of the goals behind the SCAMP project is to
create an open-standards (and eventually open-source) protocol with
bandwidth and robustness similar to those of the newer PACTOR variants.

You would not be able to use a soundmodem setup (or a TNC) plugged
into standard radio's audio output port and mic jack, for any digital
mode whose bandwidth exceeds about 2.5 kHz. Some of the newer modes
(e.g. the OFDM multi-carrier system used by Radio Mondial) exceed this
range, and require a different sort of feed arrangement from the radio
(e.g. tapping into or downmixing the final IF to a center frequency of
around 12 kHz).

>Also, is any soundblaster sound card adequate?

For many of the simpler modes, I believe that any decent card with
16-bit sample I/O capability will probably suffice.

Some PCs (especially laptops) have only MIC inputs, not LINE inputs -
these would probably require a resistive padder to reduce the radio's
signal levels to those acceptable to a MIC input. Similarly, these
built-in sound interfaces may be "convenience grade" - acceptable for
teleconferencing, but with distortion or noise levels or frequency/phase
response variations too high for certain digital modes.

260. Motorola UHF Mobiles Advice

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-17 21:56:28 UTC
From: nitespark <nitespark@cox.net>
Message-ID: <SvWGd.4912$Wp.2004@lakeread07>
Source record: 17583

I purchased a Motorola Maxtrac Model #D44LRA77A5DK and a Radius Model #D44MJA77A3CK. Both are UHF 40 watt radios mid split.

I have tried programming them and they accepted the programming, however, when I transmit, the watt meter goes to full power for a second or two and then drops back where it does not read anything at all. However, I can still detect the presence of a signal on my service monitor (the signal is off frequency).

It is almost like it is looking for some sort of ACK signal from a trunking system or something like that.

I have played around with the various parameters in the programming including simplex channels, repeater splits, etc.

I let a friend of mine look at them and he is pretty much up on Motorola equipment, especially the mobiles and he cannot figure these out.

Anyone with any suggestions, I would appreciate it.

Thanks,

Andy

Mods for that radio should be found at,

http://www.mods.dk/view.php?ModelId=182

Since your radio already tunes out of the ham bands, I suspect the mod for frequency extension has already been done.

Both operation and service manuals are available at the same site, at:

http://www.mods.dk/view.php?ListManuals=alinco

I see three possibilities here. First, the radio has a flaky VCO.

Second, you've got frequencies in there that exceed the rated band limits of the logic board's initialization, and the microcontroller is throwing a fit because of it.

Third: The radios have some sort of special firmware.

> It is almost like it is looking for some sort of ACK signal from a
> trunking system or something like that.

Exactly my point. VHF or UHF trunking systems do exist. Does the radio give any kind of error tone when you try to transmit?

> Anyone with any suggestions, I would appreciate it.

Pretty much impossible to troubleshoot via Usenet and E-mail. I'd have to have them here in the lab to do anything with them.

At the risk of generating a shameless self-plug: Conversion of Motorola hardware to amateur use is a specialty of mine, and I've got all kinds of tricks up my sleeve for dealing with stubborn radios such as yours.

If you would like me to take a look at the units, I would be happy to do so. See http://www.bluefeathertech.com/rf.html for details and rates.

Keep the peace(es).

Try the Alinco EBC-6 mobile HT bracket ($15.99 at AES). It fits on the doorpanel, has an extra strap that secures it to the top of the door panel, and not only does it have a slot for the HT's belt clip, there is another slot to the side for a speaker/mike if you use one. I bought one about three years ago at a hamfest and it's still working great.

I use 5 TNCs on my three packet circuits and three SITOR/AMTOR circuits
which I monitor 24/7 on a single computer. It *CAN* be done on a single
sound card.

But I thought I would be able to get the aircraft bands and it does not go that low. Plus one thing I read said the mods allowed you to tx but not rx those frequencies. I am confused!

This is a 20 amp switching power supply for their 12 volt ham transceivers. I used to leave it on 24 hours a day on receive pulling less than an amp with no problems but about a month ago it started to shut off. You have to turn it off first and wait about 15 minutes and it'll come back on, sometimes for an hour or longer and other times for 5 to 10 minutes. After it goes down you have to turn it off and then wait 10 to 15 and it'll come back for an unpredictable time. It doesn't seem matter if it been on for an hour or sometime 5 minutes, it'll shut down. It doesn't seem to be a cold or heat problem and flexing the board or tapping components won't turn it off or make it come on quicker. I don't have a schematic and can't find one. It must have some kind of logic that senses something and makes it shut down and then time out. One thing I have noticed is that if I turn it on when its not ready to come on I can hear a very, very faint noise (like static discharge) that goes away as soon as the switch is turned off. It has a TL494CN. Any tips appreciated.

Great pictures. Too bad it exhaust heat to the left side. My
AL-80X exhaust heat out the rear. I would consider 80B if it
could be modified to exhaust heat on the right side.

Henry:
As long as it is still w"working" the problem is not likely anything more
than either cold or cracked solder connection OR electrolytics that have
dried out or have developed high ESR. If you do not have an ESR meter then
you will have to use the "one by one" substitution method... or just replace
all of the electrolytics at once. Just about all other methods of testing
electrolytics will not provide the crucial ESR test needed especially for
electrolytics in switching power supplies and other high frequency or
critical circuitry.
DO NOT keep running your power supply with this problem.... it will only get
worse to the point that it will fail all together and be a much more
involved repair.

Your Alinco radio is FM only. Aircraft only transmit AM, so even if your radio could be made to tune down to the aircraft frequencies, it still could not hear (detect) aircraft radio traffic.

You apparently mis-read the "mods" information. No mod I ever heard of would allow you to "TX" and NOT Receive. That wouldn't even make sense. Probably you meant, receive only, without transmitting, which would be just fine as you don't want to transmit out of the ham band, anyway.

The power supply was turned on this morning at 8 am and shut down in less
than 10 minutes. I turned it back on about 9:30 and it is still on, that's
over 4 hours. I'm not that versed on ESR but I have a tester and cm
curious if high ESR can be an intermittent condition and if so what would
the physics of that phenomena be? At this point I'm not willing to do a
shotgun replacement of all the caps. I do keep running the power supply and
the condition is not getting worse. I wish it would fail so I might find
the failed component. The way it is now it's impossible to troubleshoot
without shotgunning.

A dried out cap is not an intermittent problem, but if the supply turns
off when some threshold is reached and that threshold has lowered
because of the cap's high ESR then the actual trigger would be caused by
power line fluctuations, temperature changes, etc.

A cold solder joint would be quite intermittent, but it would show up
with board flexing and other "wiggling" kind of diagnostics.

Do an ESR test on the caps. Chances are you will only have a number of bad caps. Sometimes it is best to cool and heat the caps under test. I use a heatgun, and freeze spray to cool and heat them.

This is a 20 amp switching power supply for their 12 volt ham transceivers. I used to leave it on 24 hours a day on receive pulling less than an amp with no problems but about a month ago it started to shut off. You have to turn it off first and wait about 15 minutes and it'll come back on, sometimes for an hour or longer and other times for 5 to 10 minutes. After it goes down you have to turn it off and then wait 10 to 15 and it'll come back for an unpredictable time. It doesn't seem matter if it been on for an hour or sometime 5 minutes, it'll shut down. It doesn't seem to be a cold or heat problem and flexing the board or tapping components won't turn it off or make it come on quicker. I don't have a schematic and can't find one. It must have some kind of logic that senses something and makes it shut down and then time out. One thing I have noticed is that if I turn it on when its not ready to come on I can hear a very, very faint noise (like static discharge) that goes away as soon as the switch is turned off. It has a TL494CN. Any tips appreciated.

Henry:
It is your power supply and your pocket book. If you continue to run it
until it quits altogether the repair will be more involved and probably much
more expensive than just replacing electrolytics or resoldering connections.
It might not gradually get "worse" than it is now, But rather it might have
a catastrophic failure of other parts that are stressed by the high ESR
electrolytic(s) or cracked board connections.... parts like diodes,
switching transistors, integrated circuits, opto-isolator, etc, etc.
Takes your choice and pays your money.

Henry:
Looking for cracked circuit board connections AND testing the
electrolytics with an ESR meter (or substituting electrolytics if you
do not have an ESR meter) is NOT "shotgunning".... it is real
troubleshooting advice as a result of the symptoms you posted. If you
continue to use it with the problem you reported it may fail completely
and be a bigger repair job.
Pay a little now Or pay a lot later.

Source record: 17515

I see a number of Kenwood TS-570D models on eBay and it usually seems like the person selling the unit (usually from an estate etc) can't tell if is the G model or has been upgraded to the G model. Is there some menu setting or some means where I could question the seller first to see if indeed it is the G model or has been upgraded to the D(G) model before placing a bid ? IIRC Kenwood originally came out with the TS-570D, then they improved the DSP and called it the TS-570D(G) model. I'm inquiring about the 160-10 meter version not the S series which I think includes 6 meters.

Thanks in advance.

I need to replace the lithium battery in a Kenwood TM-241A. I have an exploded view that shows the battery location, but I have no clue as to how to take the thing apart. There are a few case screws, but there are also some case seam indents that look like "pry points".

Does anyone know any details regarding disassembly of this radio?
Thanks, jimbo

Here are a some items for sale. Prices do not include shipping. I will ship overseas.

Hewlett Packard HP 331A Distortion Analyzer.....$100 plus shipping
Clean working unit. No power cord.
http://members.cox.net/radiostuff9/hp331a.JPG
http://members.cox.net/radiostuff9/hp331a2.JPG
http://members.cox.net/radiostuff9/hp331a3.JPG

General Electric TC-1 1930's Tube Tester.....$75 plus shipping
Neat art deco looking unit from late 1930's. It tests tubes from the 1920's to beyond the 1930's as it has some updated tube charts. It will test 6L6's, 6V6's, etc. It will test octal, 4, 5, 6 and 7 pin tubes. It will not test any miniature tubes. The unit works great. The front panel and case are in excellent shape. It includes instructions and tube charts.
http://members.cox.net/radiostuff9/ge_tc12.jpg
http://members.cox.net/radiostuff9/ge_tc1.jpg
http://members.cox.net/radiostuff9/ge_tc13.jpg

Digital Precision 2440 Nixie Tube DVM.....$40 plus shipping
This unit will measure DC and AC voltage, and Resistance. This unit has been tested and works. It does not include a power cord.
http://members.cox.net/radiostuff9/dp2440.jpg
http://members.cox.net/radiostuff9/dp24402.jpg

Accurate Instruments Model 158 Transistor Radio Tester.....$60 plus shipping
This unit is a Transistor Tester, Signal Generator good up to 30 MHz and Signal Tracer.
The transistor tester portion will test both leakage and gain of NPN and PNP transistors reading quality on the meter.. The combination of these three can be used singly or in combination for repairing or restoring vintage transistor radios. This unit works and is in excellent condition. It includes the test leads and the original manual.
http://members.cox.net/radiostuff9/xstr-radio_tester.JPG
http://members.cox.net/radiostuff9/xstr-radio_tester3.JPG

Batch of W.W.II Crystals.....$40 plus shipping
39 Crystals. See photo for frequencies. Here is a link to the frequency conversion chart http://members.cox.net/n7rk/ft241_xtal_list.jpg
http://members.cox.net/radiostuff9/xtal_batch.jpg
http://members.cox.net/radiostuff9/xtal_batch2.jpg

Hewlett Packard HP 410C Voltmeter for Parts or Fix
It.....$20 plus shipping

Not working. It does not include a power cord or RF probe.
http://members.cox.net/radiodx3/hp410.jpg
http://members.cox.net/radiodx3/hp4102.jpg

Vintage Westinghouse Portable DC Voltmeter.....$35 plus
shipping
This meter in a heavy bakelite measures 0-150 volts and the ranges are
changed by making the appropriate connections to the meter. The ranges
are: 1, 5, 15 and 150 volts. This is a working unit in nice condition.
The instruction card on the inside cover has a date of 1942.
http://members.cox.net/radiostuff9/west_meter2.jpg

Bud - Neutralizing Transmitting Capacitor.....$25 plus shipping
I have two of these.
http://members.cox.net/radiostuff9/neutrcap.JPG
http://members.cox.net/radiostuff9/neutrcap2.JPG

485 pF Precision Variable Capacitor with Gear (Vernier)
Drive.....$20 plus shipping
Measures 15 pF min and 485 pf max. This capacitor is in excellent
condition. Nice capacitor for a receiver or a home-brew VFO project.
http://members.cox.net/radiostuff9/verniercap.JPG

Turner VT-73 Microphone.....$20 plus shipping
Neat Brushed aluminum housing. Manufacturer is unknown. Needs a new
cartridge which you can probably get from Radio Shack to work.
http://members.cox.net/radiostuff9/weirdmike.jpg

Unknown Microphone.....$25 plus shipping
Manufacturer is unknown. This does work and was hooked to a Ranger I
when I got it. I saw picture of this mike in one of K2TQNï¿½s columns in QST
http://members.cox.net/radiostuff9/odd_mike3.jpg

Philips 4-65A tube with Ceramic Socket.....$35
Build something! I did check the filament for continuity and it is OK.
No other way to test. The beige background makes the tube
appear burned which it is not!
http://members.cox.net/radiodx3/amp_465a.jpg
http://members.cox.net/radiodx3/amp_465asocket.jpg

Thanks for looking.

You should at least test the electrolytic caps in the startup circuit.

Since as I recall, it blows up only when applying AC power suddenly, something funny is going on during startup.

AND - you can also find citings of "merchants" who were in possession of linears with intent to sell - getting busted. So, go for it! It's a roll of the dice. You've already given your address and call. Wouldn't be surprised if they even pulled your license. The "point" is, you know they are illegal devices. You are in possession of one and attempting to sell same in contradiction to FCC Rules and Regulations. Linears you might say are like crack cocaine. Illegal to possess and sell.
Ignorance is no excuse.

Henry Kolesnik:
It is NOT "intermittent ESR" that is the problem, rather it is that maybe some electrolytics have developed high ESR and are operating just at or near the threshold of the circuitry operating correctly... (see the reply post from Tim Wescott).
At this point you have been given sound technical advice to check for circuit board solder connections and to suspect the electrolytics......
until you perform this important initial suggested troubleshooting there is not much more that you can do ??? Get this fixed right away before it fails completely as you have previously been cautioned.

The measured ESR of an electrolytic capacitor changes with
temperature.... usually ESR decreases slightly. If the power supply
circuit is just at the threshold of operating correctly then very
slight changes in the ESR of critical capacitors will certainly affect
how the power supply operates and sometimes it can cause a catastrophic
failure of other components. Cold or cracked solder connections can
also cause similar intermittent symptoms.
The repair suggestion replies you have been getting to your original
posting are your FIRST troubleshooting and testing steps; otherwise we
are all guessing here.

Just a guess here, as I may have missed a post or two, but does the unit
shut down "completely" to where nothing can be traced through to see where
it stops? IF not, maybe try that too. I agree with the rest otherwise.

306. Don't do it! Superglue solvent & MFJ vinyl coating.....

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-19 19:17:20 UTC
From: Ken Bessler <kg0wx@NOSPAMyahoo.com>
Message-ID: <3nyHd.1$PB.0@okepread01>
Source record: 17529

I was having a problem keeping my station accesories
arranged in a neat order. I figured a drop of superglue
here and there would keep things where I need them
and if I ever needed to break the glue, well, that's what
acetone is for.

I glued an item to the side of my MFJ SWR meter then
a few months later, needed to make a change. The joint
"popped" easily but I was left with unsightly residue.

I soaked the part in acetone and sure enough, the dried
superglue started to turn to rubber. I checked the part
every 5 minutes but I didn't check often enough to catch
MFJ's vinyl top coat from coming loose!

D'oh!

Now I'm off to the store to buy a nice can of black
crinkle coat spray paint.

Moral of the story - use velcro!

It depends upon how the linear is to be used. There is nothing wrong
with a licensed amateur radio operator owning a linear or even
building one from scratch as long as it is to be used on the amateur
radio bands (in this case, 10-meters.) Using or intending to use one
on the CB band is obviously illegal. Without having a valid amateur
license in my possession, I wouldn't touch one with a ten-foot pole.

With all due respect, the "subject" line says it all! ILLEGAL!!!!!!!! We or at least "I" am not debating the use of "amateur" linears - factory or homebrew or the "proper" use of them - strictly Amateur band use.

Sorry, but the "subject" line of this thread is, "CB linear for sale."
Perhaps you are so hung up on the non-legal use of amplifiers you
can't see the forest for the trees.

Dick

Using or intending to use one
>>> on the CB band is obviously illegal.

AND he is offering one for sale. The tree is standing out in the open. "CB"
Linears are "illegal". You said so yourself. Amplifiers are not permitted
to be used "on the CB band". We're not talking Ham, just CB. MOST CB amps
that I am aware of - rarely go outside the CB band or if so, cover parts of
the "illegal" sub channels and into the 10 meter band. For a "CBer" to use
even if it will do 10 meters, it is "Illegal". Companies have been busted
for selling "CB LINEARS". Cut it anyway you want, they are illegal. IF a Ham
buys it and it is capable of doing 10 meters, then there should be no
problem with it IF he/she uses it FOR 10 meters. IF they too choose to go in
to 26-27 mhz, then they stand to lose their license for using a device not
authorized by the FCC for use.

In retrospect, I do believe that the linear "would" have to be proven to "not" be able to go into the "CB band", for it to be legal for Ham operation. So, a "CB" amp capable of being used in 10 meters - used by a ham, may not be as harmless as I had earlier stated (above). Of course if a ham had such a critter, they could use it and keep their mouth shut. As is the case for many linears that were/are sold new - built or in kit form, there were regulations and such to put them into operation on 10 meters. Though Hams don't necessarily have to have the amp FCC Certified, that is only to the point of it being "AMATEUR" oriented. Strictly for use in the Amateur bands. I am sure it is covered in Part 97 somewhere. I have a "CB" Linear which is parted out which for the cabinet and (hefty) transformer alone, I thought may be good for someone who may wish to build one - and I got blasted just for trying to sell those couple parts. Even E-Bay kicked it out.

If you want to read the actual regulation from the FCC -
http://a257.g.akamaitech.net/7/257/2422/05dec20031700/edocket.access.gpo.gov/cfr_2003/octqtr/47cfr2.815.htm
This basically supports what you have been saying, but there are some
limited outs for licensed radio amateurs.

It has been a while since I read all the parts pertaining to this area. So,
I guess we can say that we've pretty well beaten this dead horse to a pulp.
I wasn't trying to argue with you - regarding the amateur side of things, I
think we both can agree there.

The actual rules are to be found in Title 47 Section 97.315 (the
amateur radio rules), and in Title 47 Section 95.411 (CB rules).

Briefly:

[1] Using an external power amplifier with a CB radio is a violation.
You can't do this regardless of what sort of licenses you hold.
Doing so can cause the FCC to decide to pull whatever licenses you
do have.

[2] The FCC will presume that you have used such an amplifier with a
CB radio if you have it in your possession or on your premises,
AND there is other evidence that you've transmitted on CB with
more power than is allowed by the regs.

[2a] The presumption-of-use in [2] does not apply if you hold a
license which allows you to use an external power amplifier in
another licensed radio service (e.g. amateur radio).

So... for a licensed amateur-radio operator, it would appear to me
that the simple possession of a broad-band power amplifier capable of
amplifying across the full bandwidth of the 10- and 11-meter bands is
not, by itself, an infraction. As long as the amateur never uses it
to transmit on frequencies outside his/her amateur radio privileges,
the CB-linear-amplifier rule does not apply.

The other issue is the one of manufacture and sale of such amplifiers.
In general it is *not* legal to manufacture and sell power amps which
can operate across the full 10- and 11-meter bands - this violates the
rules in 97.315, which require that external amps capable of operating
below 144 MHz be certificated for sale (and the FCC won't certificate
amps which can amplify the 11-meter band).

There are limited exceptions to this rule encoded in 97.315, for
licensed amateur-radio operators. The most significant one is part
(b)(4), which waives the requirement for certification if the
amplifier is sold *by* an amateur-radio *to* another amateur-radio
operator.

So - if you happen to own a broadband HF amplifier capable of operating with gain across the 10- and 11-meter bands, and you're a licensed amateur, you can legally sell it to another amateur, who may then use it legally as a 10-meter amp (but *not* on CB!). The amp might have been built, and originally sold to you, in violation of the law, but it appears to me that this does not forbid you to sell it to another amateur.

Even as an amateur, though, you can't just set up a production line and start churning out such amps en masse to sell to other amateurs - 97.315 says you can only build or modify one such amplifier per year.

And, to complicate things further, the FCC has proposed eliminating the certification requirements in 97.315 entirely - this proposal is out for comment at the moment, I believe. The FCC views these rules as being cumbersome and burdensome for manufacturers and legitimate owners/users of such amplifiers, and feels that the rules in Section 95 give them all the enforcement power they need to crack down on the use of such amplifiers. If I recall correctly, this is basically the position that the ARRL took when the FCC first proposed these regulations several decades ago.

I've had a Kenwood digital VFO, the DFC-230 for years. Recently
I noticed (and never have before) that the PLL would momentarily
lose lock when the frequency readout transitioned from 19.9 to
20.1; e.g. 7020, 7040, 7060 etc. as the frequency control knob
was very s l o w l y turned.

Anyone other owners of the DFC-230 seen this?

As I said, "IF" they don't use it in the "CB band" - there should be no
problem (my earlier statement). I was just not sure (my retrospect
statement) that using an otherwise known CB linear would be legal even if

confined to a 10 meter band by a ham.

> The other issue is the one of manufacture and sale of such amplifiers.

Again, I agree. I alluded to that as well. Some companies used to send info
to add 10 meters - with proof of license.
But since I have no "working" linear and no plans to even bother using one
(been able to talk to world with stock power) I don't bother to keep up to
date with the rules. I refer to them only if needed - which isn't often -
but only if asked or in a discussion such as this.

> There are limited exceptions to this rule encoded in 97.315, for

>

Agreed! However, the ad - is what got everyone to speak up. Maybe undo
attention, but well.... most hams take exception to "CB" linears. IF selling
to a ham, maybe the better choice of words would be - Linear amp - 10 meters
capable. FS to Ham only. But whatever.... it isn't any of my business how
the ad was worded as far as "selling" or to "whom". I think the thread took
off with regard to the "legality" of "CB LINEAR" which as we know for the
most part and has been pointed out - IS "Illegal".

You sure about this? I could be wrong, but I could have sworn I read somewhere not too long ago that they were going to require "ALL" amps being sold - to be certified - to perhaps add more of a bite to their ban on them for the frequencies not permitted - in particular CB.

To be honest, as I said - I've worked the world on stock power - be it the Heathkit HW101 that I used OR my Kenwood TS440S-AT. I don't do QRP which I'd like to try sometime, but if I can talk the world on 80-100 watts legally, why the hell would I want a kilowatt or other power? Part 97 states to use the least amount necessary to carry on communications. It is the challenge of it all. It is in the system - how well you make it. With any good antenna, feed line, and a decent signal from your transmitter, a linear should be the last thing you would want or need. Though it is illegal (supposedly) to talk "skip" - I know a guy who used to talk to a few countries with just 12 watts SSB on CB with a Super Scanner Beam. Proof you don't need a ton of power to do what many people ARE doing. Power only clogs up the frequencies so no one else can talk. Be it the CB band or Ham bands. I've never been and never will be - a Linear proponent.

I have a mystery interference on HF, from 160m through 10m and everywhere in between. It's a broad, raspy noise that repeats about every 16 KHz from "DC to daylight" across the MF and HF spectrum. Someone suggested this might be from a plasma TV. There's no BPL around here (yet!). This is really annoying because it is strong and broad. Any suggestions?

73,
Dean K5DH

Hi Dean
I have the same problem and tracked it down to electrical lines about 3 blocks away.
Get in you car and put your radio on AM, drive around the area till the noise gets louder.
Usually the source of the noise is at one pole but it travels down the lines for a long way.
I presume you already tried the regular stuff like shutting off all your breakers one at a time?
Neighbor's computer? Leaky cable TV, Fluorescent Lights, dimmers, loose ac plugs.
Good Luck, 73 Chris VE3NGW/W4 Florida

A short while after I first got my license (54 years ago) there was an
amateur, W6FM, who worked all countries from his car with 2-watts AM!
I have never forgotten that feat.

Well, my memory isn't what it used to be. I looked him up in my 1953 log book (remember those) and his call was actually W6FMO (Frequency Modulated Oscillator.) His name was Speed. He was in Alhambra, and I was mobile on top of Mt. Wilson. Operating mobile back then was definitely an undertaking, with surplus dynamotors, etc.

Just purchased an FT-60R. In the sunlight, it has a discoloration on the display that sometimes obscures. (Sometimes worse than other times.) With polarized sunglasses on, this problem is severely exacerbated! I went to the retailer, who examined several of these -- all had the same problem. Is there a fix for this?

Turn your CRT monitor off and try again.

Also, check properties and look at the scan rate. It's what, 48.3KHz ? (mine is at present) Tune up and down and you should hear it again every 48.3KHz throughout the spectrum. Or whatever your scan rate is.

Flat scren don't do this. The other solution is to move your antenas as far from the computer as possible, but with most people's luck, you'll end up closer to the neighbours computer.

People can speak any way they want to, Mike. But when I am on the air, I won't talk with newbies that do not make an effort to join the ham culture.

It is okay to make a mistake while talking, it is not okay to keep talking as though one is still on CB with no intent of changing their behavior.

I too came from CB to ham radio. Before that I was an Air Force radio dispatcher and involved in commercial radio shortly thereafter. Each field requires that the operator learn the particular language for the job at hand.

I suspect that the poster that you were speaking to was merely trying to help the newbie. Not scold him.

> k5qwg

I recommend a 706 in their latest iteration. It is a great little rig, not too terribly complicated, can always serve as a mobile later on and has fairly good resale value. It is more than complicated enough for a newbie to ham radio to tackle. The 2000 can wait a while.

Better yet, buy a used 706 in the most recent model. They can be found at a substantial savings. Buying the desk mic buys you nothing in sound quality improvement. The hand mic is very good.

If you pay a fair price for the used 706, chances are you will be able to get all of your money back until the next upgraded version is introduced. Assuming there is another upgrade.

I had the same problem. It turned out that I had an unterminated Ethernet
line connected
to a hub (not a switch). The line had been installed to use a laptop in the
living room.
When the laptop was connected, the Ethernet was terminated. When it was not,
the Ethernet
seemed to be a big antenna broadcasting wide band.

The LCD displays work by polarizing the light (very simple example). When
you use the polarized sunglasses they block the already polzrized light.
The short of it is that it difficult to use the glasses with that kind of
display.

Now that's a great idea! Mine was set to 60 so I moved it to 70 and
re-adjusted the screen. Bingo! No more interference.

Yes - I realise I just moved it to another spot but it was only noticable
on 60m. On 40 it's a non factor and I generally only operate on certain
160/80m freqs. It's not there, either.

I have not seen this exact problem.

I have two DFC-230's which have exhibited various weird problems. In both cases, the solution was to add star washers between the circuit board and the mounting tabs. Over time, the "grounds" provided by the contact between the solder and the mounting tabs oxidizes and becomes high resistance. The star washers make a gas tight connection.
Once this was done, the problems went away and both units have performed flawlessly.

I heard a rumor that newer model Yaesu VX-5R radios no longer have cellular images blocked but still have cellular blocked. I had one at one point but returned it when it wouldnt receve a busienss radio system in that range I wanted to listen too (my Kenwood THF6 could do it). The range was 937 and 938 Mhz (Disneyland).

I really prefer many other features of the VX-5R and it would be great if this rumor were true. Anyone have information on this?

351. Colorado HB1045 - Ban Radar/Laser Jammers

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-21 22:37:13 UTC
From: thebigbiker@hotmail.com
Message-ID: <259623f9.0501211437.1b7e49a8@posting.google.com>
Source record: 17624
Cross-posted to: rec.radio.amateur.policy,rec.autos.driving,co.general,boulder.general,rec.radio.amateur.equipment

Hello fellow motorists & ham radio operators.

Here is a piece of legislation that is of interest to both of our communities. It is House Bill 1045 that has been passed by the House Judiciary Committee as of yesterday (1/20).

The Definition of "Radar Jamming Device" is pretty broad.

Here is is below:

(2) FOR PURPOSES OF THIS SECTION, "RADAR JAMMING DEVICE"MEANS ANY ACTIVE OR PASSIVE DEVICE, INSTRUMENT, MECHANISM, OR EQUIPMENT THAT IS DESIGNED OR INTENDED TO INTERFERE WITH, DISRUPT, OR SCRAMBLE THE RADAR OR LASER THAT IS USED BY LAW ENFORCEMENT AGENCIES AND PEACE OFFICERS TO MEASURE THE SPEED OF MOTOR VEHICLES. "RADAR JAMMING DEVICE" INCLUDES BUT IS NOT LIMITED TO DEVICES COMMONLY REFERRED TO AS "JAMMERS" OR "SCRAMBLERS".

Passive device can be interpreted pretty broadly especially used in conjunction with the word "disrupt". A solid black car without its front tag could be a passive device that would jam laser signals as defined from part 2. How about a radar detector ? Usage of a radar detector would basically cause you to slow down and interfere with a LEO's chance to extract revenue from you since when he measures your speed, you are going the limit. Sounds far fetched ? Laws are known to be liberally (sic) interpreted in the gov't favor.

For the Ham Radio community. Think about, you are driving down the road, ragchewing with someone on the 2 meter. You happen to drive by a CSP speed trap or even better yet, Fairplay PD speed trap. The officer did not get a speed on you but notices the array of antennas on your vehicle. He decides to pull you over and do a little inquiry. As defined in section 3, your 2 meter rig is confiscated by the officer. Well, guess what, you get spend some money to get your rig back if you get it back. If you do, what kind of condition will it be in. They would have no incentive to take care of the property while in their "care".

Here is Section 3.

(3) RADAR JAMMING DEVICES ARE SUBJECT TO SEIZURE BY ANY PEACE OFFICER AND MAY BE CONFISCATED AND DESTROYED BY ORDER OF THE COURT IN WHICH A VIOLATION OF THIS SECTION IS CHARGED.

This is bad legislation.

Please contact your "representative" or senator at
http://www.leg.state.co.us

You missed the "...designed or intended to..." part. So your example of a black car without it's front tag is neither designed or intended to jam laser signals. It's just a car with it's front tag missing (which probably is illegal all by itself)

Additionally, a radar detector does not jam or scramble radar signals either...it only tells the occupant that there there. So that doesn't apply.

A HAM radio rig also does not fall into the category of "designed or intended" either. Even if it did scramble the radar signal, it's purpose is not "designed or intended" to do so, so doesn't fall into that category.

The code reads clearly to me. Hopefully the cop that is applying the law has better comprehension as to what the law says than you do!

: (2) FOR PURPOSES OF THIS SECTION, "RADAR JAMMING DEVICE"MEANS ANY
: ACTIVE OR PASSIVE DEVICE, INSTRUMENT, MECHANISM, OR EQUIPMENT THAT IS
: DESIGNED OR INTENDED TO INTERFERE WITH, DISRUPT, OR SCRAMBLE THE RADAR
: OR LASER THAT IS USED BY LAW ENFORCEMENT AGENCIES AND PEACE OFFICERS
: TO MEASURE THE SPEED OF MOTOR VEHICLES. "RADAR JAMMING DEVICE"
: INCLUDES BUT IS NOT LIMITED TO DEVICES COMMONLY REFERRED TO AS
: "JAMMERS" OR "SCRAMBLERS".
:
: Passive device can be interpreted pretty broadly especially used in
: conjunction with the word "disrupt". A solid black car without its
: front tag could be a passive device that would jam laser signals as
: defined from part 2. How about a radar detector ? Usage of a radar
: detector would basically cause you to slow down and interfere with a
: LEO's chance to extract revenue from you since when he measures your
: speed, you are going the limit. Sounds far fetched ? Laws are known to
: be liberally (sic) interpreted in the gov't favor.

Key phrase here is "EQUIPMENT THAT IS DESIGNED OR INTENDED TO INTERFERE
WITH, DISRUPT, OR SCRAMBLE"

None of your paranoid ramblings are "DESIGNED OR INTENDED", thus there is no
case.

Similarly, a 2M radio is not a jamming device and would not be confiscated.

Perhaps you need protection from one of these

Well, he's selling a bunch of amps which are "illegal for use on 11
meters" but which appear to be _capable_ of being used on 11 meters
(and are pretty clearly _intended_ to be used in that fashion).

He's also selling "export radios".

Doesn't look at all legal to me. The FCC frowns on (forbids) the sale
of linear amps capable of 11-meter operation, even if they are
described as "export-only" products.

It'll be interesting to see whether this guy manages to avoid the kind
of multi-thousand-dollar fine that the FCC is levying on another
dealer who got caught selling Palomar CB linears (Paladen
Communications, last October).

Now, whether Radioactive Radios is describing the stuff he is selling
with technical accuracy, I have no idea.

The feds busted a couple companies recently for selling Export radios and
such. I hope he has a nice big piggy bank full of money for the long haul.
Sooner or later, he will go down and when he does, it's going to cost him.
Will they never learn?

L.

the best way to combat technology is with technology.

that's what's happened to radar and laser. Time for law enforcement to come up with new technology, not a new law.

that's what happens when the hunter gets captured by the game.

Not even. This country is rapidly becoming a totalitarian police state, and
for what? It won't make us safer, all it will do is allow the government to
fleece us like sheep for bucks, because we went 5 MPH over the speed limit.

The problem with intent, is that it is an interpetation initially made on the spot by the officer. I am sure you'll be able to argue successfully in court at a cost in dollars and time that some device or some object or lack there of in/on your vehicle wasn't there with design or intent to defeat a police taxation device.

Passive devices don't scramble or jam. A radar detector is a passive device. It listens, it does not broadcast. (if designed correctly) It's about how one interpets the legislation, which is the OP's point.

And yet we have all these cases where people who weren't drug dealers
lost the cash they were carrying because an officer felt it might be drug
money.

Nothing to interpret. A radar detector is not "designed or intended" to
"scramble" radar signals. Neither is a missing tag. The wording is as
clear as it can be. It seems to me that the problem here is not
"interpretation", but "comprehension".

INTENDED TO INTERFERE WITH, DISRUPT, OR SCRAMBLE

One could argue the radar detector does interfere with police usage of
the device. Take out the words PASSIVE and INTERFERE WITH and the worries
go away.

My point being, umm, I dunno now. Oh yeah, missing a front license
plate isn't illegal in Alberta and Quebec.

Thus that nice reflective surface for the laser to work doesn't exist
for us.

Trouble is I've gotten stopped at checkpoints, at the same location
three consecutive nights while in British Columbia, just because I
didn't have a front license plate. They'd take one look while walking
to my vehicle and tell me to pull over while they checked my papers.

Tony

I've owned a VX-1R then a VX-5R then a VX-7R(b) and now a
VX-2R. I'm happiest with the VX-2R. Here are my reasons:

1) Size
2) Batteries for the VX-2R can be had on Ebay for $3.00
3) Built in rapid charger
4) FAR better HF recieve
5) More memories
6) Spectrum Sweep mode

My experience with the VX series on 6 meters is they all are
terrible unless you hook up an external antenna or some huge
whip. IMHO a 6 meter HT is not practical due to antenna
limitations.

Both are good. Go for the VX2 if you can live with the lower output
power. Otherwise take the VX5. I use a VX2 for cross band repeat
and it is a fine radio. The ability to use cheap batteries is a +.

I`m not concerned with the FCC bullshit,they come and they go and they never catch'em all.
What I`m after is possibly someone thats done buisness with him and or has first hand knowledge of his "whackpack" tuneing.For $260 that General Lee he has listed is a killer deal,set up the way it is.
Run with a 10K it should be sweeeeeeet !!
With all the tweak shops out there half-assing their P/T specials on cheap meters and users thinking their large and in charge when in fact their shit aint SHIT !!.

'Cause I'm a big time crimimal, you moron. Studies have found that people
tend to go the best speed for the road they're on anyway, there don't even
need to be speed limits. Speed limits are a totalitarian way of raking in
bucks by fleecing people.

Yep,

And if the sonuvabitch confiscates equipment that happens to be purchased with DOD funds and assigned to me as part of an agency I am involved in, then I will merely contact USAF CID and make that hick cop think his a$$ was fried to a crisp by the time they get thru with him! Most of these cops think "Ah'm th' law 'roun' h'yar, boy,and what ah says goes. So you just hand over that CB reddio thar before I slap you in jail thar, you heah, boy?"

As to seizing Amateur or other radio equipment I am licensed to use, I would use the existing laws to not only
retrieve the equipment, but sue to recover ALL monies/expenses incurred in the act--probably causing the stupid cop to lose his job. And to quote a famous Warner Bros cartoon, "He don' know me vewwy well, do he!". LOL!

I sue the state and the cop if it were the last thing I ever did!!! Hang the expense--which I believe I would recover anyway. Hey, I am retired and can expend whatever time it takes! GRRRRRRRRR!

UNIDEN DEBUTS APCO 25 CAPABLE DIGITAL SCANNER AT CES

New Handheld Model Includes Advanced Scanner Technology

In an Ultra-Compact Design

LAS VEGAS, Nevada, January 6, 2005 - Uniden America Corporation, a leading manufacturer of wireless consumer electronics, will introduce a new handheld digital scanner, the Bearcat BCD396T, at the Consumer Electronics Show (CES), January 6-9, 2005, at the Las Vegas Convention Center in booth #14414. The BCD396T offers APCO 25 digital capability, allowing users to monitor the activities and signals of city and government service departments, utilizing advanced scanner technology in an all new compact, handheld design.

Featuring APCO 25 capability, Uniden's BCD396T is poised to improve interoperability between large cities currently using the digital systems and those smaller municipalities that still operate on analog systems. Uniden's BCD396T will not permit users to monitor encrypted signals from national and local security organizations.

The Bearcat BCD396T also offers Close CallT RF Capture Technology, Dynamic Memory Management, Fire Tone-Out as well as 5,500 channels and a frequency range of 25MHz to 1300MHz, excluding cellular. This new model is slated to hit shelves in late summer 2005.

"With the BCD396T, we listened to our consumers and have incorporated their feedback on features they wanted, into a high-quality product that meets the demands of both professionals, such as law enforcement officials, and scanner enthusiasts," said Paul Opitz, Uniden Product Manager. "For example, we have eliminated the proprietary battery pack and removed the need for an add-in board for APCO 25, reduced the size of the model, and added a backlit keypad."

2

Uniden also introduces additional scanner offerings, including the BC246T TrunkTracker III as well as NASCAR®-branded models such as the SC230, BC72XLT, and BC92XLT.

http://www.uniden.com/press/Apco25Scanner.pdf

http://www.universal-radio.com/catalog/scanners/1396.html

http://www.grove-ent.com/radiorumors.html

Pricing is listed at $895, but that will change. I like the flexible memory and channelization. And the built in Frequency Counter/react tuning. And using NiMh batteries.

Thats how Yay-Hoo designs radios! the image rejection is SO POOR they have
to block the images too hahahaha.
Do yourself a favor, get a REAL RCVR and forget YAY-HOO. Even the little
Radio-Shack PRO-83 (at$119) runs circles around the VX-5
is triple conversion and the first IF is over 250Mhz.
Yaesu makes junk, they will continue to dump shitty radios on hams as long
as were dumb enough to keep buying their garbage.
Your Kenwood TH-F6 is a lot more radio for the money, Most of the Yaesu
radios are built with a ($) in mind. Most of their VHF/UHF stuff is
pure crapolla, the FT-90R is a joke, the FT-7100 is a joke of a RCVR, the
FT-8100 was so intermittant it's useless. The FT-100 was a toad and the
replacement FT-100D is STILL full of bugs.
Look for the "Colored Dots" at the end of the package, it indicates which
recalls the radio has had installed (how many times it went back to the
factory before you even bought it).
look up Yaesu on www.eham.com and read all about them.
It's simple......a yellow taxi painted blue was still a taxi, a Yaesu with a
new name/model number is still a cheap piece of shit.

The Collins Radio Association, NOT the Collins Collectors' Association, has knobs at prices substantially lower than Surplus Sales of Nebraska. And CRA folks are a lot nicer than CCA too. The knobs are top quality. Then again, nobody ever accused SSN as having a price on anything that was below the competition...

Hi,

A friend gave me a JVC GZ-S3 camera and I want to use it for ATV.

This camera has a 10-pin connector to its power supply and VCR.
Unfortunately, I don't have any of the original units, so I cannot do
anything with the camera.

I want to homebrew a power supply or adapt one of the units I already have
and use the video signal for my ATV xmitter.

Does someone have some data about the GZ-S3 connector wiring?

This camera is a nice unit, with expensive optics, it was state-of-the art
back in the '80s. I hate the idea of ripping it away for parts.

Pennsylvania, the fifth most populous state in the U.S. is another
one-tag state so a PA driver is in "trouble" when he passes thru CO??
That's the point.

Beyond that assume some ham with a vehicle that looks like a porcupine
or a mobile antenna farm gets pulled over in CO and the cop sees a heap
of frederally licensed radios in the vehicle and confiscates the whole
pile on the spot thru sheer technical ignorance on his part.
Remind me to stay the hell outta CO . .

If he gets a lawyer it will cost him $300 an hour, plus court costs. Well, maybe $200 an hour. It will be cheaper to buy a new radar detector.

I can't see that happening though. I guess only time will tell if it happens or not.

No, if your state does not require a front plate, then other states that
do, honor your states one tag law. It ain't rocket surgery.

Actually, this *may* be an imposter trying to stir up trouble for the actual
holder of the callsign posted. There's a war of words going on over on
rec.radio.cb and, perhaps, this is just an effort to get others in trouble
for posting a "CB" amp for sale. I don't know that, but it could be.

Surely isn't. Or if you're *that* worried about it, get a front plate for your car in your one-plate state. I did that in Michigan (cost all of $5) on the theory that it would avoid problems when travelling to Ontario, but subsequent experience taught me I didn't have any problem driving Michigan cars with one OR two plates in Ontario.

Oh yes. I think I have been "bit" by most everything producing high
voltage since I became a ham. Of course newer equipment, like
linears, protect those of us prone to stick our fingers in things.

I ran a PE-103 in my 1937 Chevrolet coupe. It had a 30-amp generator,
and the PE-103 would suck the life out of the 6-volt battery if the
engine wasn't running. Even then you had to be careful.

I would like some info please:

1. Can anyone direct me to a supplier of D310050 final transistors used in the Transworld TW1000A or do they have reliable equivalents?

2. This TW1000A came with the Datron PS1000SWA 28V supply which also has an auxiliary output that appears to be 14,5V unloaded What is the current capability on that output as I cannot find specs on the www.

3. Would also like to know if there are other linears available today that run on 28V DC.

Your help will be much appreciated,
ZS6KR

So, why do you munge your address in the body of the message,
when it appears correctly, in all its glory, in your headers?

It's been shown that the spammers who harvest email addy's
off usenet scrape the From: addresses, but collect few of the
addresses in the body.

Using Google groups

http://groups.google.co.uk/advanced_group_search?hl=en

look through nane (news.admin.net-abuse.email) , using the
search terms:

reply-to: from: harvest

that should drop you into (MANY) discussion threads of where
folks (Spam Fighters) have seen (through "testing") the heaviest
harvesting come from.

Makes sense if you understand how reading news from a news
server works...

```
Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

Icom 02AT with wall wart.
Icom BC-35 plus extra Ice brick battery $ 65

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have severa Scsii hard drives, and a Scsii CD changer,
and an IBM PS2 8565 for parts. No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

429. Want INFO on a PROTOTYPE GONSET

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-25 00:28:46 UTC
From: Eugene Rippen <soundval@foothill.net>
Message-ID: <41f59346$1_1@127.0.0.1>
Source record: 17452

I have what I believe to be a Gonset Prototype, that was never put into production.

It appears to be 6M transceiver of the kind to have separate receiver, and separate transmitter.

It has a built in DC vibrator supply. It looks like it also worked from an external AC supply (see the 12 contact Jones plug jack on the back). However, maybe it is a combination DC and AC supply. If so, then the same two SS diodes work as rectiifiers in both operations.

I don't have the schematic. However the component chassis may have some relationship to chassis that were part of other units. I am trying to figure out the Jones plug connections; here again, maybe there is some similarity to some actual production models.

I have looked at about 12 - 15 schematics. I saw no separate AC supply. Some had combination AC and DC supplies, and they also used 12 contact Jones plugs (as my set does). So maybe I'm wrong, maybe this has a combination supply. In each
schematic that showed the wiring for a jones plug, the 110 V AC went to pins 5 & 8. If I did that, the (working side of the) switch on the front would short them. The toggle switch on the front is a 2 pole single throw. One side of the toggle swirch is not working.

The best I can figure out on the Jones plug is:
1 To the non-working side of the toggle switch.
2 Pin number 2 on the 4 prong vibrator
3 Pin number 4 on the vibrator
4 No connection
5 To the working side of the switch
6 To the transformer
7 Chassis ground
8 Other terminal of the working switch
9 Transformer
10 Chassis ground
11 Other terminal of the non-working side of the switch
12 Pin 1 of the vibrator

And here are some pics:

http://www.muchstuff.com/gonpro.htm

What I am looking for is either an expert on Gonset, or maybe some one who worked at Gonset who can give me some more info than I have admitted to above.

Here are a some transformer manufacturers of whom I would like some
catalogs, or at least the information on the unknown item.

Super Electric Products Corporation, Jersey City.
I have a choke 466-X-4

Osborne Transformer Co.?
High Voltage Transformer "Type 5962"

Franklin Transformers
Seems like I have a couple of Franklins.

Peerless Transformers
I have several of these.

I know the last two have some listings in my "Master Catalogs" but I still
would like a little info than what is found there.

That may be true, however, given recent circumstances (and statements) lead me to think otherwise. It is true that a "war of words" exists here (and on several other related usenet groups). However, it seems to me that these people that are continuing this flamwar are just arguing to be arguing (and dragging the rest of us into their petty little squabbles in the process).

However, I only commented to 1 particular post in this thread regarding the fcc and their particular policy with regard to non-type accepted equipment. as for others making of-color/snide comments with regards to characters (such as mine), they get what they deserve in the way of a response.

meanwhile, I think this thread has diverged from the original point.

stupidity is that intelligence
> has its limits.

Your Television system has a line oscillator rate of 15725 Hz. It is most likely that you are receiving interference from a nearby TV set. Try turning off the TV, or wait until the wee hours when the neighbours have turned off theirs too.

Yep, it's annoying alright. I answered a question similar to this a week ago, however, it related to computer monitors. Mine is presently running at 43.1KHz. If it is a problem, I can go into Properties, change the rate and shift the interference to another part of the band.

Nana

I had a Lettine 240 in a '67 Chevrolet with a DM 35 dyno (807 final). Did around 50 watts or so. Not only would it almost dim the headlights OUT at night, if you left your filaments on by accident, it would kill the battery in 30 minutes. Been there, done that!! LOL.

In those days, if some had told me that one day, you could have an all-band transceiver with 100 watts that was the size of some CB sets, I'd have told him he was nuts! To me, that is so COOL! I used to not think about lugging a Viking transmitter upstairs, but now it is oh, so NICE; you can practically put yer radio in yer pocket!! OF course, then I was about 19 years old!! Full of vim and vig-ah (with respect to President Kennedy ;)). Nowadays, I can still lug a Viking, but it shorrrrrrrre ain't no fun!

BTW, I still have that original DM35 dyno that was in my Chevy + a few spares. I used to visit the hamfests and, if I saw a Dyno for a buck or so, I'd pick it up. Sometimes as low as 50 cents. I still have 3 of them sitting in the furnace room--couple still in the cosmolene. One day, I'll tell you about the "dynomotor dance"! LOL!

461. HAVE YOU HEARD THE GOOD NEWS!

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-26 01:19:18 UTC
From: google_groups_web@yahoo.com
Message-ID: <1106702358.453849.167560@f14g2000cwb.googlegroups.com>
Source record: 17484

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

Some people believe that belonging to a local church, temple, mosque or synagogue will get them to Heaven.

Others believe that water baptism, obeying the ten commandments or just being a good person will get them to Heaven.

There are many other beliefs as well, but the good news about God's way to Heaven is found in the Holy Bible.

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins. After Jesus was placed in a tomb He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Bible says, "For the wages of sin is death, but the gift of God is eternal life through Christ Jesus our Lord." (Romans 6:23)

This verse in the Bible says, "For ALL HAVE SINNED, and come short of the glory of God." (Romans 3:23)

This verse says, "But God demonstrates his own love for us in this: While we were still sinners, Christ died for us." (Romans 5:8)

In this passage the Bible clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner.
I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

Salvation is not a reward but a gift. The Bible says it this way, "For it is by GRACE you have been SAVED, through FAITH and this not from yourselves, it is the GIFT of God." (Ephesians 2:8)

Nothing in the world is more important than your eternal destiny.

The Bible says, "In Him(Jesus) we have redemption through His blood, the forgiveness of sins..." (Ephesians 1:7)

If you have not yet made a decision to be saved, please do so now before it is too late. The reason why it is so important to be saved now is because you do not know exactly when you will die. You may die prematurely in a traffic accident, terrorist attack or some other way before you get another chance to be saved.

The Bible tells us that we will spend eternity in Heaven or a place of eternal torment called Hell. It would be terrible to die and go to Hell when all you have to do is accept Jesus Christ as your personal Lord and Saviour.

Some people that have already made Jesus Christ their Lord and Saviour worry about losing their salvation. The Bible teaches Christians that we can never lose our salvation no matter what happens.

The Bible says it this way, "My dear children, I write this to you so that you will not sin. But if anybody does sin, we have one who speaks to the Father in our defense Jesus Christ, the Righteous One."

Yes my friend, Jesus Christ is able to save you and keep you saved.

Please tell your family and friends, thanks!

Have a great day!

Open'er up and read off the date codes of the various IC's.
A month or so past the most recent date code ought to put
you in the ballpark. Too, you might find a QA stamp on
one of the pc boards.

I have a coil cord mike cable that came with the AZDEN PCS3000
which I bought new way back years ago. The cable however is
intermitent, sometimes it works ok many times it dont.
If anyone has an old PCS3000 in a closet somewhere and no longer
used, I would pay a small amount just to get the Mike and cable
plug.

Hi all...
I have recently accquired a Midland 70-0375C 100 watt 42-50 mhz trunk mount transciever with control head, mounting bracket, power cord, speaker and mic...
but no interface cable...
How available are the interface cables?? Can anything else be used in place of them??
Can these be reprogrammed to work on the ham bands??
If anyone is looking for one of these, let me know..thanks..

I "Think" I recall that model can be programmed and Tuned to the 6M Ham band, but the tuning process can be a bit tricky unless you have the service manual. The Interface cable should be accessable from any commercial dealer that sells Midland LMR radios. It should also be fairly cheap as the cheap version of the Interface cable is nothing more than computer type flat ribbon cable (26 conductor) with cheap plastic crimp/mash type connectors on each end.

Hi,

Would anybody know a website that would give ideas on how to set up a radio shack??Also what is the best type of mast to obtain to position the antennas on a rotator + to gradually add on antennas along the mast below each other..Thanks for looking!

Chris

Whenever I see losers here impersonating someone else, I feel sad.
Fortunately for the hobby, the impersonators aren't usually hams, and
they are usually underachievers who disappear after a while. They
live in the basement of their divorced mothers' house (until age 40).

For reprisal to me, I'll probably get a few forged postings claiming
to be me. That is why this, and every future posting I do in r.r.a.*
groups, will be PGP signed. If it ain't, it ain't from me.

Some libraries will arrange inter-library loans at no cost.

Here, at the Tempe Public Library, each patron may have
up to 3 such requests active at a time.

Sometimes, there is a small charge if they have to go out
of state (Arizona) or whatever.

479. trouble accessing repeaters

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-28 01:39:17 UTC
From: Eric Patterson <ericp@teleport.com>
Message-ID: <9JgKd.1396$Yd7.1388@newsread2.news.atl.earthlink.net>
Source record: 17352

I recently replaced the battery on my FT-470, which has a telescopic antenna. Recently, I have been having trouble accessing local repeaters. My repeater shift is set to .6 MHZ on 2 meters and 5 MHZ on 440. Is this the correct repeater shift? If so, what are some other things I could check for? I am living on the center floor of a 3-story apartment complex and can hear the repeaters ok. This problem did not occur when I lived out in Gresham. My apartment complex in Gresham had 3 stories and I lived on the center floor just like I do now. I can hear repeaters ok, but I can't transmit to them. Thanks in advance for any recommendations.

Eric Patterson, Kb7vfr, Beaverton, Or.

Do the repeaters require a sub-audible tone (PL) to access them?
If they do, you need to program your radio to transmit the proper
tone. In the 146 mhz band the shift is -0.6 mhz. In the 147 mhz
band the shift is +0.6 mhz. 5 mhz is the correct shift for the 440 mhz
band but it could be + or - depending on the local band plan. If the
repeater output is above 446 mhz it would be a - shift. If the repeater
output is below 445 mhz it would be a + shift.

>I recently replaced the battery on my >FT-470, which has a telescopic
>antenna. Recently, I have been having >trouble accessing local repeaters.

Eric....do you have the right tones programmed? This would prevent you from accessing a repeater. Check to see if the "T" is showing up on the display. Also, check to see if you're on low power or hi. Also, if the battery is the lower voltage unit (7,2V), you're outputting only around 2W of power...the 12V cellpak is needed for 5W.

>My repeater shift is set to .6 MHZ on 2 meters and 5 MHZ on 440.

Yup...that is correct for <<most>> repeaters, tho you should check. Also, make sure that your offset is in the right direction (+/- is set right). I had a -470 for years...good solid HT. One caveat...I did have the internal antenna connection crack and separate....could "barely" hear a repeater but could not hit it. Bit of solder and a piece of flex wire & I was back in business. Worth checking, esp. with the telescopic antenna, which puts more stress on the connector. I was using an ANLI telescopic when mine failed.

Of course, this may be the rig's way of saying "time to get on HF, so get the code out of the way!" QRP would be easy from the 2nd floor, if you have a nearby tree for an end fed wire (my std. hotel setup).

>Eric Patterson, Kb7vfr, Beaverton, Or.

Hope this helps!

Did you have to open the case to replace this battery (I know not
the FT-470), and did you have to unscrew the telescopic antenna
(and speaker) leads to get the case out of the away of the battery
replacement? And, did you (or whoever) overlook the antenna's
re-attachment?

Not that I've ever pulled a bonehead stunt like that..... HI!HI!

Have you heard about this new hunting reality TV show that's seeking participants? It's called "Hunting for Bambi" and it's like Fear Factor meets Girls Gone Wild. 6 guys get to hunt 12 naked women in the woods with paintball guns. Sounds like it should be a new Olympic sport if you ask me! Definitely better than hunting deer. lol! Go to www.huntingforbambi.com if you're interested in signing up.

Does anyone know if JRC is going to develop new radio equipment for ham usage? Are they still active on this subject?

The last receiver I found on their website is the NRD-545, the last transceiver probably the JST-245.

What comes next from this high-tech company for ham operators?

John and others:
Thanks for the advice. I checked in an online repeater directory and most of the repeaters I tried to access do not require a tone. As for checking the tones and repeater shift, I can't do that on my own because I am visually impaired and am not able to see the display. Even though I am only putting out 2.3 watts, that shouldn't be the problem because I have used that same power output to access repeaters in Gresham, Salem, and Medford. Do you have any other recommendations?

Give us a list of 3 or 4 repeaters you are trying to access, and we
might be able to give better advice.

I had to remind myself where Beaverton is. I was thinking it was in
the Portland area. Now that I see it is close to the coast in
southern Oregon, I would really doubt that you will have much luck
accessing a repeater with an HT. I have traveled and camped for years
along the Oregon coast when we lived in Eugene, and most of the time I
had great difficulty accessing more than one noisy repeater. And that
was with a 5/8-wave on the top of a 37' aluminum motorhome. I think
you are expecting too much from an HT. You might be able to hit the
146.61 machine in Coquille, or the 146.92 in Myrtle Point. The Coos
Bay repeaters all require a P/L tone.

Ken-

I purchased a simple 2M Lunar preamp back in the 80s. Out of curiosity I dug it out to see if it was like the one you are looking for. I see that yours is probably a combination pre-amp/power amp, not just a simple preamp, according to the data sheets I have.

There was no manual, just some mimeographed pages that apply to both the VHF and UHF versions.

The person that was listed on the literature, was Louis N. Anciaux, WB6NMT. From www.qrz.com, I found that he is now KG6UH/3F3XUG. His E-Mail address was listed at 3F3XUG as kg6uh at hotmail dot com. At KG6UH, it was kg6uh at arrl dot net.

I gather that Louis may have been associated with Lunar while in the US Navy stationed at San Diego. I didn't find out what happened to Lunar, but they may have merged with Linear Measurements in San Diego, which also acquired Non Linear Systems (NLS). Neither currently makes products like the Lunar amplifiers, as far as I can tell. Perhaps Louis could shed some light on a source for the information you are looking for.

There are actually two Beavertons in Oregon. One in Coos County and
the other in Washington County. You are probably right that he is in
the one off the 210 in Washington County. My map program threw me a
curve on that one.

503. Re: Colorado HB1045 - Ban Radar/Laser Jammers

I used to see radar absorbant material advertised at a store. If I remember correctly it was just iron particles that were supposed to deflect radar energy away from the sending unit. You'd mix it with your paint and spray it on your car, that would count as "passive" method of avoiding detection. Of course that kind of material, should it work, would only buy the driver a second or so, since material like that only accounts for around a 10% reduction in radar signature on an aerodynamic vehicle. The box you drive to work every day probably wouldn't even benefit.

Just a thought.

Source record: 17377

Has anyone successfully used the ICOM IC-2710 dual-band transceiver as a crossband repeater - received signal coming in on, say, 440 MHz on Band 1 automatically triggers the transmission on 146 MHz on Band 2?

The manual goes into length about doing this when the operator pushes the PTT but that's not what I want.

http://www.mods.dk/view.php?ArticleId=1908

As with most rigs which have a crossband repeat function, you'll
probably to use some sort of manual method to ensure that the radio
IDs itself legally (once per ten minutes), with your callsign, on each
of the bands on which it is transmitting.

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

Some people believe that belonging to a local church, temple, mosque or synagogue will get them to Heaven.

Others believe that water baptism, obeying the ten commandments or just being a good person will get them to Heaven.

There are many other beliefs as well, but the good news about God's way to Heaven is found in the Holy Bible.

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins. After Jesus was placed in a tomb He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Bible says, "For the wages of sin is death, but the gift of God is eternal life through Christ Jesus our Lord." (Romans 6:23)

This verse in the Bible says, "For ALL HAVE SINNED, and come short of the glory of God." (Romans 3:23)

This verse says, "But God demonstrates his own love for us in this: While we were still sinners, Christ died for us." (Romans 5:8)

In this passage the Bible clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

Salvation is not a reward but a gift. The Bible says it this way, "For it is by GRACE you have been SAVED, through FAITH and this not from yourselves, it is the GIFT of God." (Ephesians 2:8)

Nothing in the world is more important than your eternal destiny.

The Bible says, "In Him(Jesus) we have redemption through His blood, the forgiveness of sins..." (Ephesians 1:7)

If you have not yet made a decision to be saved, please do so now before it is too late. The reason why it is so important to be saved now is because you do not know exactly when you will die. You may die prematurely in a traffic accident, terrorist attack or some other way before you get another chance to be saved.

The Bible tells us that we will spend eternity in Heaven or a place of eternal torment called Hell. It would be terrible to die and go to Hell when all you have to do is accept Jesus Christ as your personal Lord and Saviour.

Some people that have already made Jesus Christ their Lord and Saviour worry about losing their salvation. The Bible teaches Christians that we can never lose our salvation no matter what happens.

The Bible says it this way, "My dear children, I write this to you so that you will not sin. But if anybody does sin, we have one who speaks to the Father in our defense Jesus Christ, the Righteous One." (1John 2:1)

Yes my friend, Jesus Christ is able to save you and keep you saved.

Please tell your family and friends, thanks!

Have a great day!

Here's a point of clarification:
Beaverton is a suburb of Portland, Or and is located in Washington County.
Gresham is also part of Portland, but is on the other side of town. Here
are a couple of the repeaters I am trying to access are 145.27 and 147.38.
I hope this helps.

OK. I did a search out 50 miles from Portland using the 2005 version
of TravelPlus from ARRL. I don't see any 145.38 repeaters in that
area. I do see a 147.38 in Cedar Mill which is an open repeater.

The only 145.27 repeater within that 50-mile radius is in Forest
Grove, but it has a P/L of 107.2. Hope this helps.

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

Some people believe that belonging to a local church, temple, mosque or synagogue will get them to Heaven.

Others believe that water baptism, obeying the ten commandments or just being a good person will get them to Heaven.

There are many other beliefs as well, but the good news about God's way to Heaven is found in the Holy Bible.

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins. After Jesus was placed in a tomb He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Bible says, "For the wages of sin is death, but the gift of God is eternal life through Christ Jesus our Lord." (Romans 6:23)

This verse in the Bible says, "For ALL HAVE SINNED, and come short of the glory of God." (Romans 3:23)

This verse says, "But God demonstrates his own love for us in this: While we were still sinners, Christ died for us." (Romans 5:8)

In this passage the Bible clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

Salvation is not a reward but a gift. The Bible says it this way, "For it is by GRACE you have been SAVED, through FAITH and this not from yourselves, it is the GIFT of God." (Ephesians 2:8)

Nothing in the world is more important than your eternal destiny.

The Bible says, "In Him(Jesus) we have redemption through His blood, the forgiveness of sins..." (Ephesians 1:7)

If you have not yet made a decision to be saved, please do so now before it is too late. The reason why it is so important to be saved now is because you do not know exactly when you will die. You may die prematurely in a traffic accident, terrorist attack or some other way before you get another chance to be saved.

The Bible tells us that we will spend eternity in Heaven or a place of eternal torment called Hell. It would be terrible to die and go to Hell when all you have to do is accept Jesus Christ as your personal Lord and Saviour.

Some people that have already made Jesus Christ their Lord and Saviour worry about losing their salvation. The Bible teaches Christians that we can never lose our salvation no matter what happens.

The Bible says it this way, "My dear children, I write this to you so that you will not sin. But if anybody does sin, we have one who speaks to the Father in our defense Jesus Christ, the Righteous One." (1John 2:1)

Yes my friend, Jesus Christ is able to save you and keep you saved.

Please tell your family and friends, thanks!

Have a great day!

Mine is not for sale on eBay, but I have a control box that I used
with my rotor (which is now lost).

The control box says: Alliance Tenna Rotor. Model U-100, I just
tested it and it works. It has four wires at the bottom. It has
been modified so it rotates across the north and has to be reversed
from the south, in other words, you can swing past north going between
east and west, but if you go to the south, it stops at south and has
to go all the way around to get back to the south. It was an easy
change, but I had to constantly swing between north east and north
west.

write me at my call at towncorp dot net.

Alliance made several models of rotors differing in their mechanism for indicating direction. However, the motor requirements are virtually identical. You will find two motor windings with a common connection. The motor is powered with 24 volts 60 Hz but in TWO PHASES. The second phase is supplied by placing a non-polar electrolytic capacitor in series with the transformer output. Using a center-off single-pole double-throw switch, you can control the rotor direction.

Connect the common connection of the two motor windings to one transformer lead. Connect each of the two winding leads to the switch connections. Connect the switch common to the other transformer lead. Then connect a 100 uF to 200 uF 50-volt non-polar electrolytic capacitor between the switch connections. [If you cannot find a non-polar electrolytic of the correct value, two conventional electrolytic capacitors with their cathodes (negative leads) connected together will work, using the two anode (positive) leads as the non-polar capacitor.]

In the "off" position, obviously the rotor will not turn. In either of the "on" positions, the transformer voltage will be directly connected to one motor winding and the other motor winding will be connected in series with the capacitor to the transformer voltage. One position will provide clockwise rotation and the other will provide counter-clockwise rotation.

This will turn the antenna. It's crude, but it works. You will need to know which model of rotor you have to develop an indicator circuit if you wish to go further.

If you email me I can send you the service manual pages for the U98
rotor. You probably have a U100 and this should help you out.

Cross-posted to: alt.ham-radio.hf,rec.radio.amateur.equipment,rec.radio.amateur.misc

Using an ICOM 746 Pro with an AL-80B amp. According to their respective manuals the AL-80B sources +12vdc at 100mA and the 746Pro can sink a max of +16vdc at 500mA.

QUESTION:
Do I need an amplifier keying buffer according to the above specs? My research shows primarily these devices are for new rigs keying older amps. The Icom site recommends an interface for "all non-Icom amplifiers" but in the case of the above specs it appears to me there is already a 4 volt and a 400mA "buffer" of sorts. The demands of the 80B are well inside the capabilities of the 746 Pro. Right?

I'm not trying to save $50 or so but if the specs are right I don't need it. My rig is new and I have about 300 qsos so far which amount to at least 1000+ successful amp keying events.

If anyone has this combination, I need the jumper made up to key my
linear.

Three years ago a strtoke left me with little use of my left hand, so
I can not make it up. Of course I expect to pay for time & materials.

Thanks so much

537. Icom IC-24AT problem

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-31 02:51:51 UTC
From: Jeff L <jlco01@excite.com>
Message-ID: <q27rv05blcdutnj6m9ut45vpkkvq6gabp9@4ax.com>
Source record: 17310

Howdy,

I ham buddy of mine just discovered his trusty old IC-24AT has very low power output - probably 25 miliwatts or so. Anybody have any info as to what the fix might be? (yeah, I know, replace the finals...) Before he junks it he's hoping it might be a switching diode or something simple. Or does anyone know the repair rates at Icom?

Thanks,

Jeff

Hi
I'm in the market for a pair of 2 way radios. I did a lot of reading, but it getting complicated
I have a few questions please:
remember please I'm Canadian.

1- does one needs a license for using a FRS only radio?
2- since I'm in Canada, would buying a GRMS capable radio make sense?
3- if it makes sense (GRMS), what is the benefit over regular FRS
4-do one needs a license for GRMS radios?
5-what happen if you don't have a license for your radio?
6-is there a good website on the net that explains all this for newbies, and I'm also looking for reviews? what are the good one to buy?

TIA
stef,Montreal.

Source record: 17317
Cross-posted to: rec.ham-radio.swap,rec.radio.amateur.equipment,rec.radio.swap

I have the following radio equipment for sale:

1: Panther 625P GP625HSX 136-174 MHz VHF Comnet Ericsson HT with smart desktop charger. Currently programmed for 2 meter ham band, purchaser will need to get programming. There are no scratches on the radio, in like new condition. Specs on radio can be found at this site http://www.vicmobile.com/products/macom/625p.html

$250.00 OBO plus shipping.

2: RF Applications 3KW digital watt meter in like new condition.

$150.00 OBO plus shipping.

3: Yeasu FT-857B HF/VHF/UHF 100, 50, 20 watt output with seperation kit. Missing original control head cables, I use it with the separation kit cables. ATAS 100 Screw driver antenna and four place magnetic mobile mount. There are some scratches created while installing in car, and some glue on the bottom of the head unit. But everything is in prefix working order. The ATAS 100 screw driver antenna was removed when the mobile was parked and spent very little time, outside so it is in very good condition.

$575.00 OBO plus shipping

I can be reached at n8cdw@direcway.com

Thanks Carl

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

Icom 02AT with wall wart.
Icom BC-35 plus extra Ice brick battery $ 65

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have several Scsii hard drives, and a Scsii CD changer,
and an IBM PS2 8565 for parts. No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

550. FS : Motorola MTS 2000 Model 11 SMARTNET Radio's.

Newsgroup: rec.radio.amateur.equipment
Date: 2005-01-31 23:38:35 UTC
From: alandeletethisdevlin@bigREMOVEpond.com
Message-ID: <41febd7b.8041621@news-server>
Source record: 17323
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Gidday All,
I have FORSALE a quantity of used Motorola MTS 2000
FLASHport Radio's, Model II with 14 character Alphanumeric Display.

$US200 plus Postage get's one !!!

The Model number is H01RDF9PW1BN, type RDUA with H38 - Smart Zone
operation. It covers the entire 403-470 mhz segment, delivers
from 1-5 watts, and has both 12.5 Khz and 25 kHz channel capability.
It has Simplex, Repeater and Trunking Channels programmed because it
was decommisssioned from a superceded working Trunking Network. This
radio powers up OK with NO errors & transmits OK on
"open" TX channels. The LCD Menu's change/respond OK too. All radios
are supplied with a fully charged Battery but sadly there are NO
antenna's available.......non were supplied when I acquired them.
I have LIMITED number of Charger Station/Cradles for "first in"
Buyers...but Buyers will still need to supply +13.8 volts DC as the
240 volt supplies I have here are of no use in the USA !!
SHIPPING : whatever our Aussie Post Office charges but expected to be
around $US12 for Economy AIRMAIL to the USA, slightly more to Europe.
PAYMENT : $US Greenbacks are fine... PAYPAL is fine...
Cashiers Cheque & WUMO are also OK too but an extra $US10 Fee applies
to cover Bank Charges at my end. Sorry about that.

NOTE : Although this is an R series Radio with a Maximum Specified
frequency of 470 Mhz... I have discovered these Radios have some 477
Mhz Channels installed. UHF CB Repeater Channels 1-8 and Simplex 40
are programmed !!! TX proves it on a Frequency Counter.

All responses/questions to my Email Address - don't forget to remove
the ANTISPAM bits !!

Alan Devlin.

RF RESALE... where Honesty & Integrity are paramount !
Melbourne, Australia.

Heh, okay here's another idea...Weld up the front of your car (including around the windows) so you don't have any flat surfaces that would redirect energy back at it's source, and drive with night-vision goggles...at night. Of course there is no depth-perception with those things, but you can't have everything!

-Or-

The simplest method to defeat radar is to destroy it. How about an aluminum model rocket with a J motor and a anti-radiation sensor? Just hope the poe-poe isn't using the hand-held!

From their web page at
<http://www.radioshackcorporation.com/about/history.html>

The First RadioShack Store
Two years later and half a continent away, two brothers, Theodore and
Milton Deutschmann, opened a one-store retail and mail-order operation
in the heart of downtown Boston. They chose the name, "RadioShack,"
which was a term for the small, wooden structure that housed a ship's
radio equipment. The Deutschmanns thought the name was appropriate for
a store that would supply the needs of radio officers aboard ships, as
well as "ham" radio operators.

Beginning in 1921, RadioShack would grow to a handful of stores
clustered in the Northeast, and become a leading electronics
mail-order distributor to hobbyists. This is how it would remain until
the company and a young Texan named Charles Tandy crossed paths four
decades later.
***

It would seem that the focus was on radio operators from the very
start, professional as well as amateurs, as you suspected from the
name.

It has changed somewhat since then.

Happy trails,

From: Floyd Sense <fsense@copper.net>
Message-ID: <4200d2ad_5@newsfeed.slurp.net>
Source record: 17338

Regarding position sensing: not that simple! The controller decides (mechanically) when rotation is complete. When you move the knob on the controller, one part of the dial is under spring tension and a solenoid that is controlled by a contact in the rotor itself allows the dial tension to be released one "notch" at a time. When the two parts of the dial again line up (meaning rotor is now in the direction you pointed), power to the rotor is turned off. I suggest you try to find an old control box, and make sure that the dial spring is not broken.

Yes. And they stopped selling ham radio stuff not too long ago.

| I know they used to carry a decent stock of parts, but now they just
| sell lots of toys and a few overpriced useful home electronic items.

They sell what people want. Or they go out of business.

To be fair, they do still sell quite a few radios -- GPSs, stereos,
cell phones, satellite receivers, walkie talkies, R/C toys, CBs,
scanners, etc.

The last RS catalog I read (2004?) still listed some ham radios and
antennas and such, so maybe they do still carry some, but it's all
special order now unless it's also useful for CBs (which they still
carry a few of.)

Looking at the web site, I can't find any of the HTs or mobile units I
recall seeing in the catalog, but they still sell a few ham-only items
items -- paddles, a 2m amplifier, a TNC, DSP filter, code practice
units, SWR analyzer, tuners ...

(Ok, a few of those might be useful to a CBer, but you get the idea --
they're not totally out of ham radio yet.)

But even so, `You've got questions? We've got cell phones!' and
`You've got questions? We've got dumb looks!' still applies for most
of the people that work in the stores. Which isn't surprising -- if
they knew more about electronics, they'd probably not be in what's
basically a retail sales job.

Hi Jim and thanks for the reply. It is more than just a numbers thing. The ICOM website says to use a buffer if you are using a "non-Icom linear". They don't bother to specify which non-Icom amps need a buffer . Obviously the specs for each certain ly indicate no need. I have had some hams email me saying to use a buffer "just in case". I suppose it couldn't hurt.

Good luck on the license upgrades... 73 / DX

It shouldn't take more than a couple of dollars in parts to build you own if you feel it's necessary. All you really need is a 12 volt relay. In the Icom 756 Pro III manual it says to use a larger relay if these parameters are exceeded (pg. 17).

I (in a former job), was a MARS director for one of the largest USAF bases in the US (employment wise it was the largest and the sixth largest employer in the state, Damn, I miss DARA and the Xenia groups). We used commercial solid state rigs (in our case TS-440's) to excite Rockwell linears. We didn't have any troubles operating at much higher (and closer to the max) voltages and sink currents. I also miss the HyGain Discoverer73 we put up. 3 elements on 40 meters (well, just outside the band) and 1.5 kw PEP. We were heard where ever we wanted to be.

I have a Navico AMR-1000 2 Metre transceiver with a strange fault. I cannot use the set to transmit, change freq. or illuminate the LCD display. In other words, none of the panel controls work. Whenever the mic is removed from the 8-pin socket, all is OK! However, when the mic is removed and the display is set to 'channel' rather than frequency, the set starts scanning through the band as soon as the mic is replaced.

It is NOT the mic or cable!

I checked out all mic and PTT, and the up/dn selector switches. With the mic completely removed from the set and a 10K resistor is connected to the mic pins at the set socket, it all goes faulty again. It is when a mic impedance or equivalent is connected to the set that things go awry; all switch-buttons are working normally.

The only thing to link the mic and the other functions is the control processor, as a sniff of the mic is connected to the processor (HD4074608) via a pad consisting of a 10K and 47 K resistor (toneburst output, generated in the processor and fed to the mic - acting as a speaker - so it can be heard when the PTT is operated). The fault is intermittent(ish) as all is OK for a short time whenever I open the set up and remove the 16-way plug linking the front panel to the main set, and replace it afterwards. I have checked all connections and not found any dry joints.

I am rather hoping it is not the processor which is faulty! Have any Navico users experienced a problem like this - and discovered what was doing it? All info appreciated.

The Radio Shack that I knew was a store on Central Ave in Newark NJ which sprung up sometime in the mid 1920s. I don't think it was connected with the Deutschmann group. It seemed to carry mostly surplus. I started my electronic junque box there in 1929. I still have some of that stuff, including a gridleak I just found. (What's a gridleak you say?)

>

Sounds like you need a tower Chris.

The way you set up a 'hamshack' is to put a radio on the desk, table, bench, floor, chair, etc. Wire it up to the mains, and antenna, etc. Use it till you get ready to change it and keep this up till you either give up Ham Radio or die.

Dan/W4NTI

Toledo Amateur Radio Club
7234 Latcha Road
Perrysburg, OH 43551
Attn: Trustee John C. Lagger, AA8XS

RE: Warning Notice--Amateur Repeater W8RZM

Dear Mr. Lagger:

Our records indicate that you are the trustee for the above repeater system. Enclosed are recordings of violations on the repeater by N8WWM. The transmissions continued for a considerable time and there was no evidence of a control operator.

Since you are the trustee for the repeater, it is important for you to understand that you are responsible for its proper operation. The decision to operate a repeater is a totally voluntarily one. Repeaters are a convenience in the Amateur Radio Service, not a necessity. A repeater is a station just like any other station; and under Section 97.205 of the Commission's rules, all stations must have a licensee and control operator. Under Sections 97.103(a) and 97.105, control operators must ensure the immediate proper operation of a station, regardless of the type of station control. Furthermore, "automatic" control does not mean "unattended" operation. Unattended operation is not authorized under the rules.

The repeater licensee/trustee is responsible for all recurring violations and violations that are not inadvertent, just as a licensee is responsible for a base station HF station operation in the licensee's home. You must prevent recurring and deliberate violations on the repeater by locking rule violators out, using tones, warning users, limiting its operation, or taking whatever steps necessary commensurate with your responsibility as the licensee of the station. If you are unable to do so, then you must shut down your station.

If you are unwilling or unable to prevent violations on the W8RZM repeater, then your operator and station license will be subject to enforcement action by the Commission. Such action may include monetary forfeiture, operator license suspension or station license revocation.

<chuckle> :))

> sense.

The capacitor, in series with one winding changes the AC phase
of the applied winding voltage. Remember I said it was a two-
phase motor.

The indicator function is not always that simple. Alliance
made one rotor where the control box had its own synchronous
motor that turned the same speed as the rotor. You turned the
knob to the desired azimuth which closed the internal switch.
The switch was opened when the position of the motor in the
control box matched the azimuth setting. However, occasionally
the two motors would get out of sync with each other. Turning
the knob to first one end of its range, letting the internal
motor stop, and then turning the knob to the other end of its
range and waiting for the internal motor to stop would
synchronize the two. This worked by having one of the two
motors reach its mechanical stop while the other still turned.

Another version used a rheostat winding in the rotor unit that
supplied a meter in the control box. This is a special AC
meter and one which is not easy to duplicate. Yet another
version used a switch inside the rotor that was attached to a
gear such that the switch was momentarily closed every few
degrees. In the control box, there was a solenoid that pulled
a ratchet that drove the indicator mechanism. The indictor
jumped in rather coarse steps and clicked loudly.

Probably the most modern system Alliance made used a five-wire
cable. The rotor had a much higher resistance internal
potentiometer than the older models. It was fed from DC and
drove a null-balance circuit. The control box had a matching
potentiometer, and the motor direction and the starting and

stopping was controlled by whether the resistances matched each other.

> I recall trying to find some of those non-polarized caps for a speaker
> crossover setup. Not easy to find. I never know about using two
> standard caps in that manner.

Non-polar electrolytics are two aluminum foil sheets coated with the anodic oxide film wound together with a small moist separator in between. Unlike conventional electrolytic capacitors, they cannot be reformed and they do not heal. Hooking two conventional electrolytics like I suggested forms the same capacitor but it is physically larger.

Send me your email address and I will send you two articles on electrolytic capacitors you might find useful. Take out the NO SPAM in the address below to email me.

> PS. How would I determine which is the common wire? I would assume
> the other two don't matter, it either turns one way or the other. The
> 4th, I am not sure how that one would be determined.

Get out the venerable old ohmmeter. The motor windings have a moderate resistance, although I don't remember the value (and very old Alliance units used much finer wire too). You should find approximately the same resistance from one wire to two other ones. This is the common connection. To verify, the resistance between these two other wires should be double this resistance. Between common and the indicator wire, you may measure anything from a few ohms to an open circuit depending on which model is installed.

Back in the 1960's, the ARRL did some tests on antenna rotors. When installed with the external thrust bearing bracket, the Alliance rotor was found to be almost as strong and far more rugged than the much larger ham rotors. The article was in QST sometime between 1965 and 1967.

Hey, have a '78 model Alert Monitor, M03CNB1102B
VHF unit, silver front with black case, reset/alert/mon functions.

Questions:
Original battery type, location, voltage?
Frequency range? Will it do 146.000MHz?
Is it possible to turn down the volume on the alert tone?

Need schematic, tuning and recrystal instruction.

Any help appreciated,
thanks,
rb

I'd suspect a break in the ground circuit between the front panel and main
ciruitry or in the uP area. As you've checked joints etc, maybe a cracked
PCB track?

Navico still exist but under a the name Simrad and are still in the
Broadstairs area. I'd be surprised if they have anyone who remembers this
set you can talk to but they may be able to supply a circuit.

Hi Brian, and thanks for the info.

I have a cct and some information, but not a complete svce manual. I shall certainly keep looking for broken tracks, etc! I have seen SIMRAD's website, and Emailed them about a mounting bracket for this particular set - no rely yet... :o(

The head is joined to the set by a ribbon-cable which is designed to be twisted to allow up-side-down fitting of the head. It might be intermittent as well, as might be the IDC plug to which the ribbon is connected.

Tnx once agn,

Back in the mid 70's Motorola made a console that would fit between the driver and passenger seat. It was made of a black plastic and the main use was to mount a rig on the front causing the face of the rig to face the top of the car at a slight angle for easy viewing and the rear of the rig would fit over the seat. It also contained a place for an internal speaker and a center console area that would open for storage or could be used for writing if closed.

Does anyone remember these or might know where I could find one???

I tried eBay already and have never seen them listed.

Thanks
Chuck

In sequence:

Unknown. Best to adapt it to an external 12VDC supply.

Possibly. The VHF alert monitors were spec'd to bottom out at
150MHz. It may be possible to take one lower by increasing the value of
the padding capacitors across the receiver's oscillator and multiplier
coils. It is possible that it may go lower on its own. Never know until
you try.

> Need schematic, tuning and recrystal instruction.

That could be difficult. The manual for this receiver was Motorola
part #68-81048A55. This P/N comes up as no longer in the database, which
means that it is no longer available from Motorola (considering the age
of the unit, and Motorola's feverish desire to gain profit at any cost,
I'm not surprised).

You should check in with the gang at Batlabs
(http://batboard.batlabs.com). They may be of further assistance.

Happy hunting.

590. Need help with IC 207H

Newsgroup: rec.radio.amateur.equipment
Date: 2005-02-04 02:04:17 UTC
From: Patrick <jimmyk@mindspring.com>
Message-ID: <BKAMd.9114$S3.3271@newsread2.news.atl.earthlink.net>
Source record: 17263

I just purchased an Icom 207H dual band mobile
and while it seems to have good sensitivity I have
noticed several minor problems with it and if anyone
can help I would be really appreciative.

1) The squelch needs to be turned all the way past 12 O'Clock
in order to squelch out normal noise that would probably be
knocked down at 9 or 10 O'clock with any other rig, at that
point it begins to reduce RF input, so I need to either find a
way to strengthen the squelch or eliminate the RF reduction
feature that is engaged when the squelch is placed beyond
the 12 O'Clock position.

2) The audio when transmitting is a bit low unless hold the mic
up to mouth at about an 1". That is unusual for an Icom, usually
one must back off the mic due to the hot audio, I need to find out
how to increase the deviation slightly.

If anyone can help I will make it worth your while!!!!!!

Thanks,
Patrick

My Yaesu FT-5100 went dark.
Seems odd that all three lamps should have gone bad at once??
Yes, I know about the key sequence to adjust brightness. I'd been
running it very dim. It's in the shack, so vibration shouldn't be
an issue.

I did some quick math and decided that you can have almost a watt
dissipated in the brightness control transistor. Is that a weak link?

Can someone supply dimensions for the required replacements?
Available info indicates they're inside the cover for the LCD
and very difficult to get at. Would be nice to have the bulbs
in hand at the start. Scan of the picture from the service manual
showing lamp locations would also be helpful.

Anybody got experience replacing the incandescents with leds? I'd much
rather apply an extra led or two if I didn't have to disassemble the
lcd. Doesn't have to be pretty, just readable.

Suggestions?
Thanks, mike

hi,

Just follow the instructions for me-1 installation, you open up the case
the same way to replace the lithium battery.
It is soldered in place so try to get one with tabs on it,
avoid soldering to the battery directly.

Please use a static wrist strap and static workstation pad
when you are working on this radio, the cmos circuits can
get damaged from static.

One thing to watch out for is the small chip resistors on
the top encoder board, they can break off if you are not
careful.

Can't help directly, except to say that www.mods.dk has a downloadable
copy of the IC-207 workshop manual available. With that I have no
doubt that you can find the deviation adjustment, and may be able to
find the solution to your squelch issues.

Have successfully replaced 2 lamps some years ago. Bought them at
www.conrad.com, part # 727091. 6-12V 20-40mA, 3.1mm diam, 6.5mm long. The
job took me more than an hour, but it can be done without being an expert in
micro-surgery.

From: Photoman <photomanxaa@hotmail.com>
Message-ID: <ja2dndm8puyVOJ7fRVn-gg@adelphia.com>
Source record: 17272

My old TS-820S takes forever to drop back to receive after transmitting. I'm sure it is the relay but I need a little info.

First is the relay on the on the "RELAY UNIT, X543-1190-00" the relay in question? Sound like a stupid question but I've been into a 830 before and it has two relays in it.

Secondly, is the relay in a socket?

I have found that Mouser carries a replacement relay (part #526R1617D512)which I will order if the original relay is soldered in, if not I will try to clean the relay in the radio. I will probably order one anyway to have as a spare or in case I mess up the original in the cleaning process.

I appreciate any info you may offer.

Ken,

This may be a dumb question on my part, but are you
sure it's a relay problem and not something wrong
with the VOX circuitry? Does this delay happen in
PTT operation?

It could be dirty relay contacts that have carbon
buildup. Before replacing the relay, try cleaning
the contacts. Might save you some expense.

The cable you need is a regular PC style IDE cable....just get one long enough! and make sure you maintain Pin 1 to Pin 1...I MAY have a spare control cable lying around....but if you get the correct IDC connectors and flat ribbon cable, you can make your own.....

As for programming them on 6mtr, yes they can...the radio needs to be retuned (RX Front end especially) but I have 2 of them on 6 already...(I did them over 10 years ago....found the info from Midland LMR factory guys I bribed :)
Programming requires the 70-1080 handheld programmer (about $400) OR the software AND the 70-1308 interface (about 60-100 bucks aftermarket)

I have for sale (pre-ebay) a beautiful Icom R7100 (USA version = cell blocked). I would rate this as a 9/10. It works flawlessly and is guaranteed to not be DOA. I have never opened the radio but the previous owner has and I believe a discriminator tap has been added (a female F" connector has been installed through the rear panel)although I have never used this feature.

I will ship the radio with the AC cord and a CD containing a .pdf of both the operator and service manuals.

$500.00 + shipping

Please contact me off list if interested. I hope to have pic.'s available by the end of the week, but if you need reassurance, my ebay ID is NPDXO.

Thanks...
John, thecop@optonline.net

I think you have that backwards. The SD model was the same as the base 950S with the DSP installed. The SDX was a later version. There was a QST review of the SDX that concentrated on the differences. Ones I remember are DSP installed with some more functions, different types of final transistors (bipolar vs FET I think), some additional memory functions. I believe the consensus was that the SDX was a better receiver but the S/SD is a cleaner transmitter.

is this the most expensive HAM radio? It seems ICOM keeps rasing the bar and I guess hams just keep plunking down the cash. I guess lucky for them 98 percent of ham radio operators are retired folks with plenty of disposable income. Most of the young folks are tinkering with Microprocessors,networking equipment and linux.

I'm still waiting to see the price on the Yaseu monster that'll be
competition for the IC-7800.

Your generalization on the age and income of ham ops is outside of reality.
Ham radio offers a unique benefit that no computer network or operating
system can give. Join a ham club and become involved. Involved in your
community and local disaster preparedness team. The most fun and
fulfillment I've ever had as a Ham is working those events. Try that with a
network gaming session.

FWIW, I am an IT professional... Been working with computers about as long
as I have with radios, 28 years.

Really. I'm retired, but don't seem to have lots of disposable
income. And if I did decide to dispose of $10K it wouldn't be for a
radio, especially an ICOM. Down payment on a new Corvette maybe...but
not a radio.

They weren't ham operators, but a couple won a large lottery here.
They invested all their after-tax winnings into tax-free municipal
bonds and now draw a monthly interest income of over $200,000. To
people like that, buying that $10,000 icom would be like you or I
buying it for $100. It would just about be pocket change.

Oh, well, that's life.

:)

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

Have a great day!

You are not confused
From URL:http://www.qsl.net/kb7rgg/

"Allied Radio (now known as Allied Electronics) is a company with a long eight decade history. It was founded in Chicago, IL. in 1928. Its purpose was to distribute radio parts for Columbia Radio Corp. By 1932, Allied was selling electronic parts by catalog. Storefront sales operations were established with the goal of selling to amateur radio operators and electronics experimenters. During WWII, Allied devoted itself to the war effort by handling government contracts and high-priority industrial needs. This was Allied's first real experience in industrial electronics. After the war, Allied continued to sell to the consumer and industrial markets. Sometime around 1962, Allied Electronics was created as a subsidiary of Allied Radio. In 1971, Allied was acquired by Tandy (now Radio Shack Corp.) and moved its headquarters to Fort Worth, Texas. Around 1981, Spartan Manufacturing acquired the company. In 1997, Avnet took over ownership. In 1999, Allied Electronics was acquired by Electrocomponents plc of the United Kingdom. Allied Electronics continues to sell electronic components by catalog and Internet ordering."

I have a catalog here titled Allied Radio Shack - 1971

I don't recall seeing an Allied Radio Shack catalog after the 1971 date

But Allied Electronics is live and well see URL:

Allied Radio, now Allied Electronics, was never part of Tandy or Radio
Shack. http://www.alliedelec.com/AlliedHistory.asp

Hmmm. That's interesting. I just posted that Allied was never part
of Tandy. Funny they don't mention anything about it in their history
even though they do mention being acquired by Electrocomponents in
1999. I guess the move to Fort Worth should have been a clue.

Jeez, I'm jealous, what a bargain. How cool.

Mine is a dirty beat up old piece of junk. I might be able to get it back to being clean enough to use, at least. It just has 1 broken banana jack. I suppose I could clean it up and at least use it here, it probably works.

Thanks guys. I cleaned the relay today and the rig is working perfectly. I suggest using a 1/4" X 2" strip of brown paper bag paper to do the cleaning along with a quality contact cleaner solution. The relay is the large one in the center of the bottom of the radio located, as you would expect, on the relay board or unit as Kenwood calls it. It is easy to remove and re-insert into the socket. If you try this be careful, the relay is delicate.

Thanks again,
Ken

I am trying to use a local oscillator board from an old Motorola UHF FM radio as part of a microwave construction project. I need to know the input impedance of the multiplier chain so I can design a new crystal oscillator/buffer. The original crystal frequency is in the 18 MHz region but the input coils on the board tune at around 54 MHz so obviously there is a tripler inside the channel element.

Does anyone understand how Motorola did these things ? The original channel element is a TLN 8968A - anyone got a schematic ?

73,
Steve VE3SMA

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

Have a great day!

I have a CompUSA cable router/firewall. It is causing RFI about
14.335 and various other places throughout the ham bands.

I tried wrapping it in aluminum foil. Someone suggested I try
wrapping my network wires in a toroid, but I haven't tried that yet.
It is a 100 base T switch with a 10 base T Internet connection.

Thanks for the suggestions.

>14.335 and various other places throughout the ham bands.
>
>I tried wrapping it in aluminum foil.

I assume that didn't help? If so, it suggests that the primary path
of interference may be conducted (through the network cables and/or
the power line) rather than directly radiated from the enclosure.

> Someone suggested I try
>wrapping my network wires in a toroid, but I haven't tried that yet.
>It is a 100 base T switch with a 10 base T Internet connection.
>
>Thanks for the suggestions.

I agree, try wrapping the network cables through a ferrite toroid
several times. Keep the toroid as close as possible to the case, so
as to minimize the amount of exposed wire between the case and the
toroid.

Try the same thing with the power wire. Toroids are your friends.

Try seeing if the interference occurs even when the network cables are
not connected i.e. when the router is receiving power but isn't
connected to any of the networks. I've seen at least one device which
wasn't bad when first powered up, but as soon as a network cable was
attached it started to radiate interference on the 2-meter band which
was strong enough to peg my HT's crude S-meter from 15 feet away.

You may find that your only good choice is to return the router to the
store, and buy a different brand. It's possible that the one you
bought isn't actually complying with the FCC Part 15 radiated and
conducted emission limits... and even if it is, it's clearly radiating
enough to be a problem for you.

14.335 MHz?

Al starts working about 2-5 MHz, copper a little lower. Steel is far better
at lower frequencys.

Get some clamp-on ferrites for all the cables they are about 3/4 by 3/4 by 2
inches plastic case that snaps shut, and has a big ferrite piece inside it
two C sections that clampon the cable.

Anyone know how to put one of these in simplex mode without manually setting offset to "0"?

I've seen some chatter on this in the past, but I don't recall seeing the fix.

Thanks!

Jeff

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed
God to save you. Welcome to the family of God.

Have a great day!

694. ICOM IC-2100h dead microphone

Newsgroup: rec.radio.amateur.equipment
Date: 2005-02-09 04:23:29 UTC
From: ab288@valleynet.on.ca
Message-ID: <b86ea36e.0502082023.4b12f009@posting.google.com>
Source record: 17217

Has anyone had this mic problem (HM98s) with their IC-2100h radio?
The mic lights up and the red indicator on the mic lights when PTT is
actuated
but the mic does not communicate with the radio. Functions , DTMF ,
PTT,audio, dont work for days at a time then all is well again without
having done anything
to the radio. The radio lives indoors on a power supply, has had very
little
transmitting time. There is no indication on the bar graph output
power level display indicating that PTT has been pressed. I did a CPU
reset. Nothing. I dont think its the mic itself because I tried a mic
from another working radio and still no response. Taking the mic from
this unit and trying it on the other working radio, it works fine.
The function buttons on the radio itself all work fine. The lock is
not engaged on the radio or the mic.

My wife and I got a pair of VX-150 about 3 weeks back. I've been using mine heavily, while she has only used hers maybe a dozen times. Mine stopped transmitting Tuesday afternoon; hers stopped last night. Both are in good shape otherwise: receive fine.

Anyone else seen this sort of failure in a VX-150?

I have two of these rigs and use and abuse them daily. They're built tough and I have never had any trouble at all with them. Have owned them over a year. I know a couple other people who have them and have not experienced any problems either.

I'd call up Yaesu tech support at 1-714-827-7600. Anytime I have had to deal with them has been positive, and had to send them a rig a couple times and got a very quick turnaround.

Dan

703. Alinco ALR-206T Owner's Manual

Newsgroup: rec.radio.amateur.equipment
Date: 2005-02-09 22:12:55 UTC
From: RST Engineering <jim@rstengineering.com>
Message-ID: <110l2n6ri6toi92@corp.supernews.com>
Source record: 17226

I have come by an Alinco ALR-206T that I want to put on the test bench, refurbish, and give to one of the new hams that is going through my class. Unfortunately, it came without an owner's manual, and while I could probably figure it out given enough time, a newbie is going to be SOL trying to get it to fire up.

Does anybody have the pertinent sections out of that manual that they could scan and send to me (jim@rstengineering.com) or copy and put in an envelope (RST Engineering 13993 Downwind Ct. Grass Valley CA 95945) . I'll be happy to remit copy and postage charges.

It also needs a power connector. The power connector looks like an old-fashioned "cheater cord" type of connector with two pins inside of a rectangular housing about a quarter of an inch high by half an inch wide, with a small keyway molded into the bottom edge of the housing. Anybody got a source for these puppies?

Put a plate under the roof, if you're willing to remove the headliner,
or on top of the roof, if you're not, to stiffen that area. I think that
under would be better for multiple reasons, and you've got to get into the
headliner anyway to deal with the cable, don't you? You shouldn't need a
lot of plate -- say 6" square or 6"x12", with the long axis oriented
front-to-back. The NMO mounting nut may be enough, or you may want to use a
couple of fasteners to keep the plate straight.

Temporarily you could loosen the NMO mount ring and look to see if the two tabs which fit UNDER the roof metal are aimed forward and rear. If so, you could simply turn the assembly 90 degrees so that the two tabs now fit under the roof hole right and left side. This is assuming that the tilt was due to the bending of the front to rear part of the hole, but left and right side of the hole still being flat.

Ultimately, some kind of added thin steel plating under the roof hole would be the only thing I can think of at the moment. I've seen some plating added to the top side, which worked, but looked like heck.

Good News!

Do you know how simple it is to go to Heaven after this
life has ended?

The good news is that God came from Heaven to earth
in the person of Jesus Christ over 2000 years ago and
died for our past, present and future sins(misdeeds).
He was born in the land of Israel supernaturally to a
virgin Jewish woman named Mary. He lived a sinless life
for thirty-three years and then sacrificed His sinless
blood and died on a cross to pay the death penalty for
our sins.

After Jesus died He rose from the dead three days later
as He said He would. The Holy Bible also tells us that
Jesus Christ ascended into Heaven and that all who accept
Him as their Lord and Saviour will live forever with Him
in Heaven where there is no more death, sorrow, sickness
and pain.

The Holy Bible very clearly explains how simple it is
to be saved and on your way to Heaven, "For if you
confess with your mouth, "Jesus is Lord," and believe
in your heart that God raised him from the dead, you
WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if
you will open your heart to Jesus and pray the following
prayer:

Dear Jesus Christ, I want to be saved so that I can have
a home in Heaven when I die. I agree with You that I am a
sinner. I believe You love me and want to save me. I
believe that You bled and died on the cross to pay the
penalty for my sins. I believe that You rose from the dead.
Please forgive my sins and come into my heart and be my
Lord and Saviour. Thank You Lord Jesus Christ for
forgiving me and saving me through Your merciful grace.
Amen.

You are now a Christian if you said the prayer and allowed
God to save you. Welcome to the family of God.

If you decide to wait till later you may die before you get
another chance to be saved because none of us knows
exactly when we will die.

Have a great day!

Loosen the NMO mount rig. Straighten the antenna but dont
retighten yet. Squeeze a liberal amount of J& B weld into the
hole. Retighten the NMO ring. A simple fix that works every
time.

73,

Lloyd

I have obtained a mass quantity of high quality "CellularOne" 12 volt cig. lighter adapters, unused. I have over two dozen, most in the original package. You can clip off the cell phone plug, and add your own. Rat Shack wants eight bucks for theirs. Mine are FREE. (Limit two, please. $4.95 shipping and handling for one. $6.95 S&H for two.) Email me via tinytenna@hotmail.com (Photo at QTH.com. Just put my call in the search engine.)

There's a manual online at Mods.dk. It's 635-k zipped:
http://www.mods.dk/downloadmanual.php?File=ALR-206_Instruction_manual.zip

In case that link gets chopped, here's a smaller one:
http://tinyurl.com/3qdob

You might try All Electronics ... they have a large supply of connectors and other miscellaneous surplus electronic goodies. If you can't find what you're looking for on their web site, call them up or email them and request a free catalog. The inventory in the catalog changes every few months, so you might find something there.

I've run across those and that's the only way I found to set it. The manual
is available online through Mods.dk, but I quickly scanned through it and
didn't see anything helpful about this.

Now THAT would be a miracle!!

How long did it take Uniden to finally stop using awful battery packs in
their handhelds? I'll be dead by the time they get a handheld that has
really decent RF performance.

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

Icom 02AT with wall wart.
Icom BC-35 plus extra Ice brick battery $ 65

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have several Scsii hard drives, and a Scsii CD changer.
No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

At my job we use motorola HTs on UHF (400MHz+) using DPL/DCS
squelching. Sometime in the next few months we'll migrate to different
motorolas on VHF (150MHz+) using PL/CTCSS.

I'm a ham, but a somewhat inexperienced one.. I was wondering if y'all
could direct me toward a few dual or tri band HTs that would be easily
modified to tx those freqs, preferrably with the DPL/DCS capability
(since I think most radios come with PL/CTCSS), but if you know of one
that is super easy and only does PL, that would be great, too.
Comments on performance (ie intermod) are appreciated, too.

I've hunted around on mod sites and have come up with a couple of icoms
and a few alincos that appear easy enough to mod.. But, I wanted some
opinions from y'all.

There's probably no need to post the mod, I'll find it on the
internet.. Unless you want to make it easy on me and link to it. :-)

TIA! 73,

kc5rsv

Thomas,

Did I get this correct? You want to modify an amateur radio so it
operates on a commercial band?

What you are doing is setting yourself up for a $10,000-$20,000 fine
and possible suspension or loss of your amateur license. Regardless
of technology, it is against the law to use non-type accepted
equipment on services requiring type accepted equipment.

You can read about some of the penalties imposed by the FCC on the
internet. I think the ARRL has quite a few reports.

You can get HT's and mobiles that will monitor the frequencies you
want to use if you like.

If you want to operate those frequencies, you might check with the
source from which your company is buying rigs and tell them that you
would like one that you can use as well but have a small budget. They
may find a used one for you that they can program for both your
company use and amateur use.

Good luck,

And... stay out of trouble, ok?

Buck,

Thanks for the reply. I'm actually working outside of the US right now, where the FCC doesn't care and no one else around here seems to. I met another HAM here who's doing the same thing (with an IC-V8) and really there is no one here to complain. Rest assured, I wouldn't care if I were in the states.. And, when I get back to the states if I don't leave the radio for someone else I'll not be operating it out of ham bands. :-)

Have a good one!

73,

thomas

> deal with them has been positive, and had to send them a rig a couple times
> and got a very quick turnaround.

I ran some tests yesterday, and then called the number above and had a
nice chat with the guy who took the call. Since each will talk to the
other in simplex mode (in tone squelch mode as well as out), but both
fail to open any of the local repeaters, it's pretty obvious that they
are transmitting on-frequency and that the RF power out just isn't
enough to do the job with the repeaters, which indicates that both HTs
have had the final fail. That was my conclusion before the call, and
the Vertex guy thinks it probably is correct.

They're in the mail now, and the turnaround is 5-7 business days. *sigh*

Unfortunately, many of the scanners have been not so hot.....if it wasn't a case of front end overload, it was a case of reciprocal mixing as a result of the poor phase noise from the synthesizers. The Regency MX7000 was an example of a poorly executed receiver. The Yaesu VR5000 is a joke.....I hooked it up to one of my RF generators (Boonton 103D), and this receiver was driven into RF clipping at only 50mV. At a 20mV RF level, I could hear the signal at plus or minus 150kHz. For the record, the generator has a phase noise characteristic of -140dBc @ 10kHz offset. Low noise unit, suitable for avionics applications. The Icom R100 and the AOR2002 weren't bad units.....these radios used a passive doubly-balanced diode ring mixer, but unfortunately, their synthesizers' performance left a bit to be desired.
The Motorola radios seem to have the best front ends, at least in this country. There are some overseas suppliers that make good equipment, but unfortunately, these units are aimed at the land mobile community.
I did pick up the BC896, and for a cheap radio, it isn't bad. They appear to have added another 30dB of gain to the AM I.F. strip, so at least, airband performance is better.
Oh, and intermod isn't a problem limited to ghetto areas. It depends on how well the radio was designed.

Pete

First thing I would do is check to make sure there are serial numbers on them. If there are, it might not be a bad idea to run them through your local police department (the serial numbers).

As for recovering the money, that should be fairly simple. I would give you a minimum of $200 for the pair in as is condition, and I'm sure there are folks who would give more than that.

I've worked for a major radio company & about 95% of the ham radios
that came in for repair have been taken out of band.
(No, we never did the mods)
But I do have to say, these guys take them out of band & try to run
them at full power for long periods & invariably fry the PAs!
Goodbye warranty & hello expensive bill.
You'd be better off in the long run either buying a commercial radio,
or something like an Icom M88 (programmable free channels and
ctcss).

<snippety>

You really don't want to do that if you plan to transmit with
them, at least if they're amateur-only transceivers.

The reason can be summed up in two words: Type Acceptance. In
order to be legally usable on frequencies other than amateur radio, a
transceiver must be type accepted by the FCC for the radio service it's
made for.

This means that the manufacturer of the equipment submits their
design details to the FCC, and the feds then say 'yea' or 'nay' on
whether said design is found to be acceptable for the specific radio
service in question. Amateur radio transceivers do not require type
acceptance because of the non-commercial nature of the service.

Using a non-type accepted radio on frequencies outside those it
was designed for will get you deep trouble should you get caught. The
feds have already made this very clear in the form of the recent
crackdowns on truck stops and CB dealers selling illegal linear
amplifiers, and CB radios modified to go into the amateur 10-meter band.

Now, with all that said: It is perfectly acceptable to buy a
commercial type-accepted radio, and program amateur frequencies into it
(assuming you have the appropriate amateur radio license). God only
knows how many hams have done this already, myself included. In fact,
conversion of commercial gear to amateur service is a specialty of mine.

> There's probably no need to post the mod, I'll find it on the
> internet.. Unless you want to make it easy on me and link to it. :-)

Do you really want to risk both your amateur license and that of
the commercial service you're trying to talk to? Yes, both of them WOULD

be put at risk by use of a non type accepted radio.

If you must do what you describe, get a commercial transceiver and stick ham frequencies in it. The other way around is just not a good idea.

Heh heh... "they weigh quite a lot." That's right. So you think
you're gonna sell them by the pound?

I'll tell you right now. They aren't worth crap if they don't work.
I'm assuming that you don't have the expertise to test these units out
yourself, or you'd know that a working TS-520 would go anywhere from
$150 and up depending on condition and buyer's desire to own one. I
certainly hope that as a businessman you haven't bought these without
having them looked at by someone with some degree of expertise in this
kind of equipment. If you DID, then I've got a whole box of "working"
radios here I'd like to unload on you!

Check out eBay. There are a lot of rigs for sale 'for parts only' or
'technician special'. You might be surprised what they are worth
non-working.

As someone else pointed out, check out the S/Ns with the police.

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed
God to save you. Welcome to the family of God.

If you decide to wait till later you may die before you get
another chance to be saved because none of us knows
exactly when we will die.

Have a great day!

Here is a scan of an article in a French amateur radio mag.:

ftp://ftp.yehudi.ca/ham-radio/ic-7000.pdf
(not my site, and it's often slow)

As I interpret the French text, the new rig is a little smaller than the 706, has a color screen, clock, voice recorder, larger backlit pushbuttons, and 508 memories. IF DSP and PBT provide improved noise blanking and eliminate the need for accessory filters. A microphone with 10 buttons is included as standard equipment. UHF output is now approx. 35W.

I have found no official announcement of this rig anywhere, but Icom France is reported as saying that the IC-7000 will be available starting in 2Q, 2005. No price is mentioned.

Perhaps it will be at Dayton.

Disaster preparedness? Hams? LOL! I was involved in a backcountry
avalanche years ago & could only get one ham repeater in the area,
when I announced that I had an emergency ,the folks on the repeater
suddenly went silent (no help or response)!
A few years later I joined (temporarily) a ham emerg/disaster
group..I didn't stick around long because of the infighting/language
issues..a bunch of uncoordinated clowns with the physical , social and
mental charcteristics of water filled balloons!

heh that is funny, I heard this happens.

It appears that they improved the menu function too.

It looks good. I hope it works as well as the 706.

Hi all. I will send you an update on the issues I have had accessing repeaters. Last Wednesday, I took my HT with me to the local amateur radio club. When the meeting was over, I had another radio operator check out my HT. Here's what we found:
1. The radio is transmitting ok. I was standing in the parking lot while he was in his vehicle. I was able to use my HT to call him.
2. The repeater shift is ok. I made sure it was set to .6 MHZ for 2 meters. I don't think the problem has anything to do with tones because the problem occurs when trying to access open repeaters. Does anyone else have any recommendations? Thanks again.

Source record: 17142

Well point one:
When you listen the frequency dial should read the output frequency
When you transmit, the display should read the input frequency
Make sure the offset shift is proper -- up or down, + or -

Point two. Some repeaters are "alligators" big mouth, little ears so to speak. Thus easy to hear, difficult to get enough signal into the repeater to key it up. I have a repeater here that is 40dB over S9, but I can't raise it (90 miles away) it is way up in altitude on a Mt top.

Point three: Some repeaters are designated open -- meaning they are open to all hams -- but they might require PL. Many here in So Calif are that way.

Point four. While at the Ham meeting -- see if another Ham can raise the repeater with their HT

Point five -- connect your HT to an outdoor antenna -- a rubber duck is a lousy antenna.

It may be that you are expecting too much trasnmitt range out of the HT. Make sure the radio is on its highest power output. Then get next to someone that can access a repeater with his HT and see if you can. Some 2 meter repeaters shift up .6 and some shift down .6 MHz.

If the ground is level or close to it you should be able to talk about 3 miles to a mobile unit on a direct frequency. YOu need to measuer the output power. If you do not have a meter maybe you can get your hands on a 1/2 watt resistor from about 40 to 60 ohms. Put that on the rig instead of the antenna. One lead to the center of the BNC connector and the other to the outer part of the connector. The resistor should get very hot in 20 seconds or less. If it does not get hot then you may have a bad final stage in the HT.

I agree. It will save you a lot of time and wondering, if you just
stand next to another ham and try both HT's. If he can, but you can't
access, then start looking at your HT. If neither of you can, then
you need to change the game plan and realize that you are trying to do
something that can't be done with an HT.

Try getting a better antenna than the stock rubber duck.

A 1/4 wave is necessary around here for reliable operation during PS
events.

If you know the physical location of the repeater, try from very
close.

Also, on repeaters with tone, make sure you have set your rig
correctly. BTW, open repeater usually means that it is available for
all, and it still may have a tone.

Well, $29 US, $35.85 Canadian, actually, if anyone's counting.
Selling it in cleaned up, refurbished and tested form, along
with a 5-day right-of-return could raise the price.

Daiwa 2-meter amplifier model LA-2035R

You are bidding on a Daiwa 2-meter amplifier model LA-2035R. It operates in SSB, CW, and FM mode. Input power is 1-4 W. Output power is more than 30 W. This unit is designed to operate with a handheld transceiver. It has a pre-amplifier for the receiver. The original instruction manual is included. It has been tested and works as advertised.

SPECIFICATIONS
Model LA-2035R
Frequency 144~148 MHz
PreAmp Gain 15dB
Input Power 1~5W
Output Power 3W in 30W out

Power Consumption 13.8V DC/2.8A Max.
Dimensions(mm) 100Wx35Hx140D
Access. Wt. with RX 550g

True with many other kinds of specialized products as well. You will
end up having zero local advice, zero local support, and have to wait
for every item to be shipped.

And, if you look at total cost, the local dealer is not always much
more expensive, and if you factor in shipping, maybe even less.

Happy trails,

I've got an MFJ 1270B TNC-2 that I will probably never use. It is free to a good home. You can pick it up at Sierra College in Rocklin CA, at Sierra College in Grass Valley CA, or you can send me a self-addressed stamped box with enough postage on it for a 2- pound package that will hold something about the size of a regular box of Cheerios.

Email me if you want it; it is into the trash on Wednesday, the 16th of February.

Jim

UNLESS you're working through repeaters and live in the valleys of a mountainous area. Then you're working bounces and if you get too high (high off the ground, but not as high as the hilltops around you), you can get up out of the signal.

GU-84B Homebrew amp. 90% finished have ALL componets to finish plus MUCH more. This was a project i started a few years ago and my current situation requires me to down-size and get rid of some things.As you can see from the page listed i have choose to use only the best in this amp. This will have to be a pick up only amp as it is way to heavy to even think about shipping.Bring a pick up or van you will need it! I will fill it up for you.Will give you all the paperwork Everything will come with this to complete it. Would like 1000.00 Might consider partial trade. Have way more invested in this Amp but need to move it on to a new Home. :) If you have ever tried to find all the parts for a HB amp then you know what i mean! Give me a shout i am sure we can work out a deal of some sort.Thanks for looking. http://www.nd2x.net/NI4L.html

805. IC-706 and noise level

Newsgroup: rec.radio.amateur.equipment
Date: 2005-02-14 13:53:21 UTC
From: Zibs <zabarnick@udri.udayton.edu>
Message-ID: <1108389201.149645.229180@z14g2000cwz.googlegroups.com>
Source record: 17080

I recently purchased a second hand Icom IC-706 transceiver (original version, not MkII or MkIIG) after a long absence from amateur radio. I have noticed that I hear a lot of noise with my doublet at 20 feet. In particular, when I turn the preamp on, the noise level is S9 on all HF bands. Is this normal for this rig? With the preamp off, the noise level is usually down near S1-3. I know the S-meter is not well calibrated in the IC-706, but has anyone observed this behavior? Obviously, this makes the preamp useless, as only stronger signals are above the noise level.

Thanks.

Steve, KI8AA

I HAD a mark 2G, notice I said HAD. It seems icom never learned
how to make a decent noise blanker. I have had several ICOMS and it seems
they all had sucky noise blankers. I don't know about the HIGH end ICOMs as
I could never afford those. I do know that I am much more satisfied with my
FT-897 and FT-817 rigs.

One can also have a problem with height if the get so high as to key
multiple repeaters on a common frequency. While this is more commonly
a problem with aeronautical mobile stations, it also happens around
here for stations on hills between several repeaters or whose beams
line up with more than one repeater.

I have run into this when hiking, and operating from various summits.
I keyed up a repeater in Boston from the summit of Mt. Monadnock
(southern NH) and also got a repeater on the same frequency in CT.

Hi there,
there is a P6243 oscilloscope probe on eBay:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=3874238523&ssPageName=ADME:B:LC:UK:1

(If that hyperlink dont work its item number 3874238523)

This looks ideal for what I want but it says it needs a TekProbe port.
I sure dont have one of them. I'm guessing this only supplies
power/recognition of the probe.

Does any one know if its poss to power one of these probes externally
and use on a non-Tektronix scope?

Cheers,
PeteP

Yeah, I experienced that too in 1991 on top of Mt Mitchell, NC, 6685 ft.
back when few repeaters used tone squelch. 5 watts and I made several people
angry in the southern states.

No one really angry, but a few people in Boston were confused when
they only heard my side of the conversation with the ham in CT,
although there was no other traffic on the Boston repeater. Only the
Boston repeater has tone, the other one doesn't.

I have also seen some areas deal with tone added for intermod control
by having all of the repeaters in the area (coastal Maine for example)
use the same CTSCC tone. This simplified things for hams with older
equipment.

Happy trails,

Source record: 17092

A year or so ago I put out a message that I had a pair of Eimac 3-500Z tubes that were new, but have been sitting in a box for 35 years. Asked a few questions and received a few replies.

Pleased to report that the tubes were finally fired up and are working fine. They are dated 1970. Filaments were warmed up for a day and voltages applied by a rheostat, slowly.

About 20 years ago I paid $50 apiece and simply let them sit. I have a Kenwood TL-922A amp so now I have some backup tubes.

Just a follow-up to a message sent a long time ago.

FWIW, I have both (note: the Pro, not the II or 3). You can read the specs elsewhere and the reviews in various places. My personal comments are:

I have them sitting side-by-side -- both feeding the same amp and antennas. It is just as easy to power up one as the other. My fingers almost always go for the Mark V. Partially this simply ergonomics. The VFOs, for example, are smoother on the Mark V, all the buttons and knobs are bigger (and I have big, fat fingers). The Mark V has a better receiver -- which is most noticeable on the lower bands.
Negatives on the Mark V:
keyclicks (much improved since I added the Inrad "fix").
If you don't work CW, doesn't matter
needs filters for extra cost (semi-related: the inrad narrow roofing filter helps quite a bit on crowded bands)
no 6m without an expensive transverter which is a semi-pain to use.
I have the transverter, but almost always use the Pro for 6m
Menu system from the 1970s. the good news is that these are set and forget functions
No bandscope -- which I find quite useful on quiet bands (read 6m)
needs special power supply, so more money when it needs repair
big, heavy

Negatives on the Pro:
100w versus 200w.
Receiver not as good
I think the Mark V's antenna tuner is better, but I seldom use either internal tuner
No Class A option

All that said, the Pro is quite a bit cheaper once you figure in the cost of the extra filters for the mark V

Can anyone make a recommendation for a used rock solid reliable
dual-band base radio?

You see, I like my radios to last forever. And when they do break for
them to be repairable (repair cost not exceeding the value of the radio).

Did Ten-Tek ever make a VHF/UHF radio?

Thanks for your help.

Hello All,

I have a Tait T-500 UHF transceiver, which is a standard 2 channel machine.
These are good and cheap radios and work very well on Ham bands.

I understand that there was a conversion mod that replaced the diode matrix
with a eprom board, to give from 8 to 100 channels.

Now because these radio are now a little old, I am searching for any
information on building or getting one of these boards.
If anyone could help, please address a message to myself.

Regards

Kevin, ZL1KFM

-My club (LA1K) still has an Yaesu FT-726R which sees occasional use.
Never managed to destroy the thing, despite several serious attempts from
club members.

Of course, minor repairs have been undertaken - a few caps have been
replaced, and the T/RX-switching modified to suit our PA and preamps.

Through-hole components used inside - no smd. :)

842. Yaesu FT-416 manual?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-02-15 21:20:18 UTC
From: nwrailscan <corpcoastfan@yahoo.com>
Message-ID: <1108502418.640507.307320@l41g2000cwc.googlegroups.com>
Source record: 17015

Hi all,

Just purchased a Yaesu FT-416 handheld, however the previous owner no longer has the original manual to go along with it. Did a search on the web but turned up very little. Wondering if anyone knows where I could possibly find a copy of this manual, maybe in .pdf format, available online, and preferrably without spending a bundle?

Does anyone have access to one for photocopy, scan, etc? Are there any similar radios whos manuals may suffice (816, 415?)

Thanks, and 73!
Shane

843. Questions on Yaesu VX-150, IC-2100H, MFJ-4225MV

Took the test on Saturday, got my call sign today. EXCELLENT service
from Larkfield ARC, Huntington, N.Y.

Now comes the moment of truth. Thanks to Gary for his recommendation
of a VX-150 handheld. At some point in the future, I would also like
to get a mobile to use at home. I've looked at the Astron VS35M as
well as the MFJ-4225MV. The latter looks a little smaller and a lot
lighter. Does it have enough power to run the IC-2100H without a
problem? Are there any issues with this ps that I should be aware of?
Does the supply have to be connected to a ground rod or cold water
pipe? There are really none available where I will be setting up my
"shack". The outlet that I will be plugging it into is a 3 prong
outlet.

I plan to get the VX-150 with the E-DC-6 cable which appears will
allow me to run it off of a power supply (which may be a down the road
purchase). Does the dry cell pack accomodate NiMH batteries? I have
several sets from my digital camera along with a charger. Any other
recommendations here?

Is it worth getting the Yaesu combo mike/speaker?

Lastly, any recommendations on a reliable mail order dealer? I've
been looking at HRO and they appear to get some pretty positive
feedback.

Sorry if I've been rambling, but I'm kind of excited. I thought that
I would be waiting several weeks for the call sign.

Thanks and 73

Rich

Manufacturers are required to keep parts for only seven years after
ceasing production on a model -- while many parts are replaceable,
things like tuning encoders and and illuminated displays are generally
proprietary, and hard to replace once the manufacturer stops making
them.

>
>Did Ten-Tek ever make a VHF/UHF radio?

Ten Tec currently offers a 2-meter FM/data transceiver kit with a
30-watt amp; nothing for UHF, though. See their web site for details.

My main concern is how long will the display last, without this the rig is useless. It might be hard to beat the older rigs as some after 10 years you can still see where your at.

Congratulations, and welcome to something I started in 1962 and then
let lie fallow for 42 years. I got my General in January, after my
Novice (WN5EGO) expired in 1963. Something about college and a war.

W5DNA, my wife, and I have a pair of VX-150 HTs, which came in late
January. Both are now back at Vertex for service, and both show the same
symptoms: low RF levels at the antenna. They failed the same day, which
is suspicious. Until they died, they worked *just* *fine*, and they were
really easy to program and to use. I really do think that we just got a
pair with burn-in problems: she had keyed hers up maybe two dozen times,
max.

> Lastly, any recommendations on a reliable mail order dealer? I've

We got ours from GigaParts.com; good, fast service.

They're pretty darned fast about getting new licenses and license upgrades
in: I passed the Extra exam last Thursday, and the upgrade is already in
the FCC database. Wheeeeee!

Rich,
Congratulations on the license! Will try to answer your questions:

1) Power Supply - go with the Astron, they are well built and the 35
amp model you are looking at will be more than enough for powering a
dual band mobile unit in the home. In general I think you should
avoid MFJ, some of their products are good but it is a gamble and I've
found their customer support to be lacking. Seldom do you hear of

folks having problems with Astron power supplies though.

2) Yaesu and accessories - you'll find that folks have allegiances to manufacturers (the big 3 being Kenwood, Icom & Yaesu) much like some folks swear by GM and others at it. I don't think you'll be unhappy with your choice, though I do suggest that if at all possible you view this (and other) radios in person and see if you are comfortable with the layout of the controls and also read the manuals on programming to see which ones seem more intuitive to you. If you don't have a local dealer you may wish to check out a local ham club and get the chance to meet others in the hobby and actually play with some different radios. A speaker mic can come in handy, but is not necessary up front and there are non-OEM models that you may like more than the Yaesu offerings and they are typically easier on the budget.

3) "AA" Pack & batery type - Wouldn't recommend rechargeables in an "AA" case though as they only give 1.2 volts and that may not provide sufficient voltage for the radio - others more familiar with this consideration will hopefully offer their input on this. Also, check out the radio manual (many are online) and see what it says about minimum voltage requirements. You may be just fine, I'm just not "expert" enough on this to give you a definite answer.

4) Dealers - I've mail ordered from AES and they have shipped promptly. Have also dealt with HRO, in person, and have had good service. Best to see which offers the best pricing and buy there.

I hope this helps to answer some of your questions, welcome to amateur radio!

Hello,

I picked up an HM-133S MIC on eBay and the vendor stated that it works with my IC-2100H. Although the LED on the MIC comes on I can not command the radio. I tried unlocking the MIC (FN+16) but no dice -- any suggestions/thoughts?

Thanks!

-Paul, KN6PH

From: lorenzo.simoncello@inwind.it (Lorenzo Simoncello)
Hallo! I've got a Standard Model HX245U(EA) UHF FM tranceiver.
Marantz Japan Inc. (Made in Japan)
My tranceiver has broken down and I'd like to try reparing it.
Has anyone the user manual, the electric scheme or some other usefull
information), please?
May you send me by email?
Unfortunately now it's very difficult to receive information directly
from Vertex Standard or Marantz aboout this old tranceiver.

Thanks and King Regards from Italy

Thanks Mike,

Strangely enough, I still have my first QSL card. Dated 1960. I was 8 years old then and a "backseat operator". My father was active from around 1960 until 1976. He wanted me to become a ham, but the code always put me off. So, here we are 45 years later, 2 years from retirement and ready to "yak".

BTW - I ordered the VX-150 from Gigaworks today along with a few accessories. Nothing elaborate. I'll be looking for more advice as I progress.

Unfortunately, the local club here meets on a Thursday at 8:00 PM which is my bedtime. I do tech support for a living at generally get up at 4:15. Once I retire, I expect to get more involved locally.

Thanks again,

Rich

Thanks Howard.

You're right about MFJ. I e-mailed a question to them and never heard back. This is a sale waiting to be made and they can't deal with it. Imagine the post sale support.

I'll probably run the VX-150 on batteries for awhile and then go for the Astron. Eventually I plan to get something like the ICOM IC2100-H and put an Arrow J-Pole antenna in the attic. I have a house, but the chimney is really not a good spot and from what I hear the J-pole should work fine in the attic. We will see. I guess that I can always move it later.

Thanks again,

73

The 756 pro & II have a few bugs with feedback on 6M when the
protection diodes & IC151 fry on the RF board.
You're OK until the warranty's expired.

878. Icom AH-4 mobile users: radiating element?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-02-17 13:24:02 UTC
From: k5dh@raytheon.com
Message-ID: <SV0Rd.1$Or6.0@dfw-service2.ext.ray.com>
Source record: 16951
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

Icom AH-4 mobile users:

I recently installed an AH-4 antenna tuner in my mobile station, connected to my IC-706Mk2G. I'm using a 9 foot stainless steel CB whip as my radiating element, fed by about 2 feet of wire from the tuner to the base of the whip. What kind of radiating element are you using, and what kind of success do you have with it on 40m and 75m? I also have an Outbacker Perth antenna that I've used for many years, but I got tired of being unable to jump from band to band easily. I've thought about using the Outbacker with the AH-4, and just omitting the Wander Lead and matching transformer connection (in other words, use the Outbacker in its "raw" 75m state). I'm a bit concerned that the AH-4 won't handle this on 40m because the AH-4 manual says to avoid odd multiples of 1/2 wave, and that would be the case using the 75m antenna on 40m.

Let's hear your thoughts and experiences!

73,
Dean K5DH

I was using a similar setup as yours. IC706MKII and the AH-4 tuner on a 9ft whip. I went back to my Webster Bandspanner and got consistently better results. While it was convenient when changing bands, it does little good if you cannot make the contact.

This setup might be good at the peak of a solar cycle when you can make the communications trip with lower power, but in average or below average conditions I think you are losing too much using the tuner and a whip.

I have run a similar set up with the SGC - the 2 foot bit in the car is a
serious
bad point, to the extent that SGC actually make a "bracket" that enables the
box to be clamped to the outside of the car and the whip is mounted on part of
this bracket,
right up very close to the output terminal - the aerial on these boxes starts
and is very "active" at the output terminal.

You HAVE to understand and appreciate that to make them work at all, if not
particularly spectacularly - they are primarily a "convenience box" over a
"performance box", so do have their place, but are quite a compromise.

Nick

Hi Dan and you make a valid point about feedline loss. I am feeding M2 HO LOOP with 65 ft of 9914F low loss coax which incidentally enough is a "direct bury" coax. I use a 35 ft run of 9914F for my Ringo Ranger II. I have a 50 ft run of the same 9914F direct buried feeding my Hustler 5-BTV vertical. At HF frequencies especially with 9914F there is virtually no loss at 50ft.

Link for 9914F coax, jumpers and assemblies and coax loss tables. The 9914F is within .1 db of 9913 loss figures but is more flexible and can be buried directly into mother earth....
1. http://www.radio-ware.com

TY for making a good observation but in my case your "preaching to the choir". Hi Hi

I'm putting the finishing touches on a Heath HO-10 restoration
and need to touch up a few scratches on the case. This is the
dark green color Heath used on this line.

Does anyone know where I can buy touchup paint for this? Is
there any automobile color similar?

> hof to fix it?

This is often caused by leaky or dried-out electrolytic surface-
mount capacitors on the display PC board. Repairing it requires two
10uF/16V surface-mount caps, the proper desolder/resolder equipment, and
the skill to use it.

The detailed service manual, covering all Spectra models, is
Motorola part number 68-80102W61, current list price of $40.45.
Considering that the thing comes in a two-inch thick binder, and is
nearly the size of a small phone book, that strikes me as a pretty
decent deal.

I would also strongly recommend that you get the basic VHF service
manual as well: 68-81070C95, current list price of $24.75. It contains
interconnection and accessory information not found in the detail book.

Both manuals can be readily ordered from Motorola at 1-800-422-
4210.

> The Spectra Model Number is: DA7KX+067W (VHF)

FYI: That's not a valid Motorola model number. That is, in fact,
the FCC ID of your radio. Motorola had a problem with their model/serial
labels during the time the Spectras were still in production, in which
the radio's actual model number and the FCC ID were transposed.

The actual model number will likely look something like this:
D43FWA7JA7AK, or some similar appearing string.

If you decide that you do not want to do the repair yourself, or
if you lack the equipment to do so, I can do it at rates considerably
lower than most commercial shops. Visit my web site for details:

http://www.bluefeathertech.com/rf.html

I hope that helps.

Hello Joe and welcome to mobileing (hard word). I have over 20 years of county hunting behind me and I have DXCC, WAC and WAS many, many, times over while mobile. I've paid my dues like most all county hunters have and I'll tell you most CH'rs run Icom and Kenwood so perhaps you should start there. The Screwdriver antennas and the BugCatchers are the only antennas that I would ever put on my car/van/etc. I do recommend top-hats for both of these types and I am a firm believer that the biggest models are the best, my ears and S-meter know this to be true and the shootouts prove it. If I were in your position (more money than you can spend)I would put the Predater on my vehicle right off the batt! You only have to decide if you will be fanatical like us or if you just want to enjoy the experience of HF mobile (I love that too), you will also have to take your wife's suggestions seriously :o) One of you could die from this adventure :^O If not married you have it made and got the bull by the horns.
Do a search on screwdriver antennas and bug-catcher antenna.
Good heavens you are in for a blast!

That would be them, yes. Those are the two key suspects for an
awful lot of problems, including the tone you describe and dim or no
display.

> I can see that D43KXA7JA7BK is printed on the label at the back of the
> radio, as the ID No.

That's more like it. What you have there is a 35-40 watt output
unit, dash-mount, secure-capable (with the appropriate daughterboard,
encryption hybrid, key variable loader, and cable), 128-mode (channel)
capable. The 'A7' towards the end indicates the control head type, in
this case a full-keypad unit.

Such radios rarely have trouble covering the amateur 2m band in
its entirety, no matter if they're Range 1 or Range 2 units.

Happy fixing.

With a 13 ft. whip and SG-230, it made a pretty good
20m-10m mobile antenna for me.

Has anyone out there ever used a cubex quad antenna? I am looking to buy the
2/6 meter quad either the Hornet or the KingBee II and would like to get
some feedback before I do.
Thanks
73's
de kb2sin Bill

> 20m-10m mobile antenna for me.

Hi Cecil,

I have one too - and I am sure it does make an excellent mobile antenna
system with 13 feet on its output.

I use mine for "hotel room use" mainly, or any quick lash up in available
space.
I am constantly amazed by the results I get and wouldn't part with it.

On the car I use a resonant whip about 3 feet long on the gutter for 40M and
equally that works well....

For a permanent fixed sytem though its an expensive convenience over other
systems
based on e.g. wire dipoles.

It is a great box though !

Nick

I just came across an old army radio test set, a TS-970A/U built by Motorola. Does anyone know how old it is, or if it might be worth anything? It's really quaint, with a laminated instruction book and everything. Looks like maybe 1940's. I can't even find any reference to that number on Google.

Source record: 16978
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

Are they good, bad, hard to understand, etc?

Does anyone here even have an Alinco rig with the board in it? When you use digital mode to work someone with a similarly equipped rig, how is it? Garbly? Not too bad, ???

Eham.net lists only three comments, and none of them are flattering, but they don't specify why they disliked it, just that they did.

(or is it that these things are so rare, almost none were sold? Someone must be buying them, there are no EJ-40U units to be had in any store that I can find.)

So, if you have some first hand experience with these things, please drop a note here.

Thanks for reading,
Pat

Sounds cool, really.

908. WANTED: CB radios from Raytheon, Apelco, Airline

Newsgroup: rec.radio.amateur.equipment
Date: 2005-02-19 02:11:31 UTC
From: k5dh@qsl.net
Message-ID: <GZudncXzt8TOPYvfRVn-3A@centurytel.net>
Source record: 16981
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.cb

Greetings from Texas!

I'm looking for the following vintage CB radio
equipment to complete the collection of the
Raytheon/Apelco/Webster CB Radio Museum:

Raytheon:
- RAYCOM III (23 channel solid-state AM mobile)
- RAYCOM IV (23 channel solid-state AM/SSB mobile)
- Ray-Ette (single channel handheld w/regenerative rx)
- Super Ray-ette (single channel handheld w/superhet rx)
- Any Canadian models except the TWR-2C

Apelco:
- 565 (5 channel AM mobile)
- Any Canadian models except the AR-10

Webster:
- Any Canadian models

Airline: (sold by Montgomery Ward)
- GAS587 (tube-type base station)

Also looking for any and all manuals, literature, boxes,
advertising, mobile mounts, hand mics, crystals, power
supplies, accessories, parts kits, et al, for any and
all Raytheon, Apelco, or Webster CB models.

I'm not interested in marine radios except perhaps as a
source of restoration parts (tubes, knobs, meters, mic
cords, power cords, internal components etc). I will
buy marine radios if I think I can use their parts,
but I won't pay much for them (shipping is too high to
pay a lot for parts radios that I might not be able to
actually use).

Raytheon/Apelco/Webster CB Radio Museum web site:
http://www.qsl.net/k5dh/raytheon.html

Thanks and 73,
Dean K5DH

909. WANTED: vintage Tekni-Cals water transfer decals

I guess I should clarify that the 2 foot piece of lead
wire is all outside the vehicle except for 4 inches.

I overheard a station the other day saying that he was
using an AH-4 to load a 17m HamStick on all bands from
75m through 10m. I was thinking of doing the same but
using a 30m HamStick (not resonant on any ham band that
allows SSB operation). Anyone tried this?

Hi Dean,
You can make your own water slip decals by purchasing media from a number of WEB stores- try Google search under water slip decals. In your case you will need to find someone with an ALPS printer to do white.

I overheard a station the other day saying that he was
using an AH-4 to load a 17m HamStick on all bands from
75m through 10m. I was thinking of doing the same but
using a 30m HamStick (not resonant on any ham band that
allows SSB operation). Anyone tried this? ....

It's pretty mediocre...It would be much better to actually tune
the hamstick to the different bands by changing the stinger
length.
But it would take a long stinger to tune 75m, with no loading
coil. A 10 meter hamstick can tune 20m by adding appx 2 ft
longer a stinger. A 20m stick can tune 40m by adding about 4-5
ft of stinger. I did that for a while, and it works much
better than you might think.
Myself, I always tune the antenna to resonance by using a hi-Q
loading coil. There is less coil losses, but also the current
distribution is much better, which raises the efficiency
quite a bit.
I just mounted my antenna on my #2 truck. It's even
higher than my other truck. I installed a ball mount on
the cab, about 6 inches below the roofline, on the pillar
between the back window, and my side window. The base of the
antenna is 64 inches off the ground. My antenna is 11 ft
total height, and is center loaded in the driving mode.
That puts my loading coil at about 124+ inches off the ground.
The stinger is 5 ft...Yep, it's tall, and I whack trees
o-plenty. But it works very well. I also have a 3 ft mast,
that I can add to the antenna, and have the coil 8 ft from
the base. The total height is about 19 ft....:) Naturally,
I don't drive with it that tall, but use it stationary...
That antenna compared to a tuner loaded whip?
Ain't none...:(I'd probably be 2-4 S units louder than you
on 75m to the average person...
A friend of mine wants to run a tuner loaded whip...I can't
talk him out of it...Oh well...I'll catch him some day after
he installs it, and do a side by side comparison with my
antenna. It's gonna be ugly the way I spank his heiney on
75m....:/ 40m too, to a slightly lesser extent...
BTW, I also have a shorter 10 ft antenna , with the coil at
about 2.5 ft off the base...It's my old antenna...But I'm
gonna use it on this truck for a "heavy tree" antenna when
I'm in town...With the coil lower, it will take trees better.
But I'll use the other anytime I'm on the road. This

is the highest I've mounted a mobile so far...I'm over the
legal limit of 13.6 a bit, being mine is about 16 ft tall
total..But it sways back, so when moving I can clear stuff
lower than that. A tuner loaded whip is ok on 20-10, but
even still, the hi-q coil antenna is still that much better.
On 20m, my antenna is like being at home...I don't use many
turns of coil on 20m...The efficiency is pretty high.
MK

Copper is better than lead. :-)

> I overheard a station the other day saying that he was

Hamsticks have a nasty characteristic. A 75m Hamstick is
self-resonant before it gets to 40m. A 40m Hamstick is
self-resonant (~9 MHz) before it gets to 30m. Self-resonance
is the frequency at which the inductive reactance equals the
stray capacitive reactance and results in heavy losses. I
don't know the self-resonant frequency for a 30m Hamstick
but I'll bet it's lower than 14 MHz.

Source record: 16992

I have all three [well I have a 1000MP anyhow]. All three are great radios. The 756Pro has everything built in and the scope and the receiver is very good. The 1000MP has a better receiver, but you would only notice in very crowded band conditions where it's superior dynamic range will be appreciated and with the new Inrad roofing filter installed [$165], the 1000MP's have an outstanding receiver, as good as anything other than a Ten Tec Orion. If you are a dx chaser and you absolutely have to get that new one, then the 1000MP would be the choice. For most of us who chase "convenient" dx or casually participate in a contests, the Icom 756 Pro would be all we need 98% of the time. Don't get me wrong as you can work tons of dx on either but if that rare one is barely readable and other strong stations appear nearby you will appreciate the 1000MP. --- Steve KK9ZZ

Im tellin yah it workx and its so worth it

Turn $5.00 into $50,000...read this to find out how!!!
READING THIS COULD CHANGE YOUR LIFE!!!
I found this on a bulletin board like this one and decided to try it.
A little while back, I was browsing through a newsgroup, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $5.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was curious, so I kept reading... I also did an internet search and found nothing but success stories.

Anyway, it said that you need to send $1.00 to each of the 5 names and address stated in the article. You then place your own name and address in the bottom of the list at ..5, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured "what have I got to lose except 5 stamps and $5.00, right?"

Then I invested the measly $5.00 (I use the word "measly" because $5 really is measly compared to the money I have made through the initial investment). Well GUESS WHAT!!... within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in.
In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over $10,000.00 and it's still growing.

This is now my fourth week and I have made just over $42,000.00 and it's still coming in rapidly. It's certainly worth $5.00, and 5 stamps, I have spent more than that on the lottery!!
Let me tell you how this works and most importantly, why it works....
Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it.
I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy!

Suggestion:
Read this entire message carefully! (print it out or download it.)
Follow the simple directions and watch the money come in! It's easy.
It's legal. And, your investment is only $5.00 (Plus postage)

IMPORTANT:
This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk - it really works!!!! If all of the following instructions are adhered to, you will receive extraordinary dividends.
PLEASE NOTE:
Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days.
This program remains successful because of the honesty and integrity of the participants. Please continue it's success by carefully adhering to the instructions.
You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists.
Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list.
Here are the 4 easy steps to success:

STEP 1:
Get 5 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST."
Now get 5 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery).
Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the phrase "PLEASE
PUT ME ON YOUR MAILING LIST.", your name and address, and a $1.00 bill.
What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL!
You are requesting a legitimate service and you are paying for it!
Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal!
Mail the 5 envelopes to the following addresses:

..1) Jason R
3702 Werner Ave.
Austin, TX 78722

..2) J Arenas
1600 Malibu
Carrollton, TX 75006

..3) Richonda S
CMR 402 BOX 274
APO, AE 09180

..4) J Roth
2901 Barton Skyway ..3406
Austin, TX 78746

..5)Jesse James
1778 Swift Ave.
Ventura, Ca 93003

STEP 2: Now take the ..1 name off the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 32,000+) All you need is 200, but remember, the more you post, the more money you make!

This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again.

PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions.
Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way.

NOTE:
You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.)
So, as each post is downloaded and the directions carefully followed, five members will be reimbursed for their participation as a List Developer with one dollar each.
Your name will move up the list geometrically so that when your name reaches the ..1 position you will be receiving thousands of dollars in CASH!!!
What an opportunity for only $5.00 ($1.00 for each of the first five people listed above)
Send it now, add your own name to the list and you're in business!

---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS----------
Step 1)
You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the
entire letter into the computer's memory.
Step 2)
Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list.
Step 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you'll always have this file to go back to.
Step 4)

Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions, etc.)
Step 5)
Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this
will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button.
You're done with your first one!
Congratulations...THAT'S IT!
All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!
REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200
That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.
JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.
Now the WHY part:
Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at ..5 on the letter.
Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at ..5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at ..4 and only 5 replies each, I will bring in an additional $125.00!
Now, those 125 persons turn around and post the MINIMUM 200 with my name at ..3 and only receive 5 replies each, I will make an additional $626.00!
OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at ..2 and they each only receive 5 replies, that just made me $3,125.00!!!
Those 3,125 persons will all deliver this message to 200 newsgroups with my name at ..1 and if still ONLY 5 persons per 200 newsgroups react I will receive $15,625,00!
With an original investment of only $5.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 again. And start posting again.
The thing to remember is do you realize that thousands of people all over the world are joining the internet and reading these articles everyday?, JUST LIKE YOU are now!!
So, can you afford $5.00 and see if it really works?? I think so...
People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try?

Estimates are at 20,000 to 50,000 new users, every day, with thousands
of those joining the actual internet.
Remember, play FAIRLY and HONESTLY and this will really work!!!

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

If you decide to wait till later you may die before you get another chance to be saved because none of us knows exactly when we will die.

This means that if we die without trusting in Jesus Christ as our Lord and Saviour we will be forever separated from the love of God in a place called Hell. This place called Hell is a place of eternal torment, suffering, pain and agony for all those who reject Jesus Christ.

Choose Jesus Christ today and you will have peace in your life now and forever.

Have a great day!

I am using Kenwood headphones, HS 5. Anyone using them know that they are mono and not stereo...I have also noticed that these headphones are not as loud as others I have tried.
I was wondering if replaceing the mono plug with a stereo plug would make any difference, has anyone tried this? This should also increase the impedance to 16 ohms as both headsets are in paralell. The other question is, would this have any adverse affect on the audio output transistor? Jim

He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed
God to save you. Welcome to the family of God.

If you decide to wait till later you may die before you get
another chance to be saved because none of us knows
exactly when we will die.

This means that if we die without trusting in Jesus Christ
as our Lord and Saviour we will be forever separated
from the love of God in a place called Hell. This place
called Hell is a place of eternal torment, suffering, pain
and agony for all those who reject Jesus Christ.

Choose Jesus Christ today and you will have peace in your
life now and forever.

Have a great day!

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

If you decide to wait till later you may die before you get another chance to be saved because none of us knows exactly when we will die.

This means that if we die without trusting in Jesus Christ as our Lord and Saviour we will be forever separated from the love of God in a place called Hell. This place called Hell is a place of eternal torment, suffering, pain and agony for all those who reject Jesus Christ.

Choose Jesus Christ today and you will have peace in your life now and forever.

Beams are a little tough on 75M. Not much easier on 40M.

Hi There,

I have the following for sale on eBay that might be of interest to you.

COLLINS KWM-2A TRANSCEIVER with Control Unit (WINGED EMBLEM)

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=4674&item=5753493575&rd=1&ssPageName=WDVW

COLLINS 75S-1 RECEIVER (Winged Emblem)

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=4673&item=5753498993&rd=1&ssPageName=WDVW

Both in working order and good condition.
Will ship world-wide.

Thanks for your attention.

Wish I could dig out my old photo of the beam farm at the RAAF base in
Western Australia (town and base name currently lost from memory).
Impressive site though! Right down to the low Meg's.

Ken

Secret Marconi Day Station - South Dorset Radio Society

Just to let you all know that the South Dorset Radio Society will be running a Marconi Day special event station from the little known Marconi site at Portland Bill. The site was used by Marconi to make first contact with Gibraltar.

It is so secret that the members don't even know about it yet and the RSGB have not published details of the special callsign. This is due to the fact that they don't want the Portland club knowing that they are invading for the weekend. So SSSSHHHH! Don't tell anyone.

Reply to Carol 2E1RBH, but don't look at the spelling on her emails. 2e1rbh@g3sds.org.uk

Does anyone know of a source for a switch which accepts two incoming PL-259's (A/B) and spits out either A/B or B/A, depending on switch setting. The object is to switch the feedpoints of a rhombic antenna from one end to the other. The two "incoming" lines to the switch are from either end of the rhombic. The two outgoing (from the switch) go to a dummy load and the tuner/transceiver.

TIA.

Bill W2ET

Hamsticks have a nasty characteristic. A 75m Hamstick is
self-resonant before it gets to 40m. A 40m Hamstick is
self-resonant (~9 MHz) before it gets to 30m. Self-resonance
is the frequency at which the inductive reactance equals the
stray capacitive reactance and results in heavy losses. I
don't know the self-resonant frequency for a 30m Hamstick
but I'll bet it's lower than 14 MHz. ....

Yea, you never want to use a low band stick, for upper
bands...Those sticks *must* have a decent stinger whip
to do any good. No capacitance, no worky....
But using a upper band stick on lower bands, by adding
more stinger works great. The antenna gets better and
better, as you drop bands, and add stinger length...
IE: a 10m stick tuned to 20m, by adding 2 more ft of
stinger works very well. Better on 20, than 10, if the
stinger on 10m, is a short stub..
Ditto for 20 to 40, etc...
When I ran a 6 ft 20m stick on 40m, using a 5 ft
stinger, that antenna was nearly as good as the
average bugcatcher. No joke. It kicked butt...
But that stick had the coil windings at the top, and
not evenly wound over the whole height, so current
distribution was real good. Much like a lumped coil
antenna. Just a thinner coil....MK

What you are looking for is called a "transfer switch". You may want
to look for a surplus one. Transco made such a thing, both as relays
and as motor-driven switches.

None of these will be found with SO-239's tho.

Bill:

Some many years ago I needed such a switch for some experiments on 2 meters. Since it was the weekend and I was in a
hurry, I took one of the old A. H. & H. DPDT toggle switches, some bus wire and 4 N connectors and made one with leads
as short as I could make them. It is still in use, and makes a surprisingly small impedance bump in the line. I
suspect at HF, it would be invisible.

I have a general class ham license but have been out of
it a LONG time

I want to get back into some form of free ham radio
comms that would allow me to stay in touch with people
while living in an RV

So.... I want something small and compact. And Im not
sure what "mode" of communications I want. I may want
some form of digital comms like packet or pactor....
not sure

Any advice on all this? What to get equip wise? What
modes to get into?

That will work. If you are running high power, you may also want to consider
a wide spaced rotary wafer switch.

Hi all I am helping a friend promote a web site. You see a childhood friend of hers lost her husband at the World Trade Center on Sept. 11, 2001. She has run into some hard times and my freind wants to help her. So she came up with the idea to market Just say NO to Bin Ladin dartboards and punching bag covers. Not only is she going to donate part of the proceeds to her freind but an additional part of the proceeds will go to the Firemans Fund. If you could take the time to check out the web site it would be much appreciated!! The web site addy is:

http://www.angelonmyshoulder.4t.com

Thanks so much everyone!!

Well let's see.....the Yaesu FT-857D or the Icom 706 Mk 2G come to mind right away. With either rig you have all mode 160 thru 70CM operation. They are not too large and do 100W 160 thru 6M--50 W on 2m and 20 W on 70CM. If you want QRP then the FT-817 is the rig you want, ALL MODE 5W 160 thru 70 CM.

There are many radios to look at.
The Icom 706 mk IIG is a great small 100 watt HF rig that will also do VHF and UHF. The Icom is driven via menus and takes time to get use to.
I have a Yaesu FT-847, a small base radio that can be used in the car and does 160 - 10 plus 2 meters and 440. It's larger than the Icom.
There are other small radios also. I'd would stay away from QRP radios. They work well but you need a lot of patience. They only run about 5 watts or so and many people get annoyed using them because they just don't have enough power for every day use.
73 and good luck.

Does anyone have a junked out Yaesu 2500M?
The display on mine has a bad place in the lower right side can't read the last number. Metal notebook slide off set in van and struck that area now the liquid inside is running. Anyone else ever have this happen to them? Is it even worth fixing or should i just buy a cheap frequency counter and hook it in line?
thanks
Chris NI4L

I HAD an ICOM 706 MK IIG and now I have an FT-897, the 897 is the same rig pretty much as the 857 only it has a bigger box for batteries to be added for portable ops. I got rid of the 706 because the DSP was done in the audio stages and not in the IF where it belongs. I also think the 897 has a better receiver. The 706 is not a BAD rig, I am just more demanding for what I want to do. Have you considered PSK-31?

That's my gut feeling as well... to stay away from QRP
rigs for now

Again..... the intended usage is to get back into ham
radio..... and to keep in touch with outside world in
possible remote locations

Plus.....Im very interested in the ham equivalent of
internet email..... i.e. dig comms that is

It is a lot easier to keep in touch with other hams with ham radio,
somewhat more difficult to keep in touch with non-hams.

Having a 2 meter FM rig will allow communications locally, and with
repeaters around the country. Other VHF or UHF bands will add to this,
but 2 meter only will get you through.

An HF rig with a decent antenna will allow long distance comms. You
will have to compromise to get one that is portable, and mounts on
your vehicle.

Packet radio would work for email, but bandwidth is rather limited
compared to the worst dialup options. 1200 baud is common, 9600 is the
most out there. Dialup Internet providers range from 28.8 to 53K.

Depending on who and how you wish to keep in touch, you may still want
a cell phone and set up with a national dial-up ISP.

Happy trails,
Gary (net.yogi.bear)

Agreed..... no doubt

>Having a 2 meter FM rig will allow communications locally, and with
>repeaters around the country. Other VHF or UHF bands will add to this,
>but 2 meter only will get you through.

Would 2M only suffice for the "email/packet" end of
things tho? I mean.... since an RV will be moving
from one area to another.... does that affect the
transmission and reception "protocols" of email sent
via 2M packet?

Sorry for the dumb questions guys. Please bear with me
ok?

>An HF rig with a decent antenna will allow long distance comms. You
>will have to compromise to get one that is portable, and mounts on
>your vehicle.

Fortunately these all mode and all band radios now days
look pretty small tho. Correct?

>Packet radio would work for email, but bandwidth is rather limited
>compared to the worst dialup options. 1200 baud is common, 9600 is the
>most out there. Dialup Internet providers range from 28.8 to 53K.

Understand. But since things are automated and once I
buy the equip I have it and there are no other monthly
"costs"..... what will it hurt if it takes all night
for the rig/computer to send that email message? Cant
it be doing it's "thing" (sending and receiving email)
while Im asleep or doing other things?

>Depending on who and how you wish to keep in touch, you may still want
>a cell phone and set up with a national dial-up ISP.

Oh sure. Just looking into ham radio as a cheap method
to use as well

985. Looking for a Drake R8b

The availability and density of ham packet-radio nodes (whether on 2 meter, 220, or 440) isn't what it was a decade ago. The widespread availability of Internet access, and the low costs and high bandwidths, have lead to a big "decay" in the amateur radio network. Even here in the SF Bay area (densely populated, high-tech-oriented population) there just aren't more than a handful of 2-meter and 440 packet nodes and BBSen left operating, and most of them seem to be special-purpose rather than being set up for open use.

In order to use packet at all, you have to find a node or BBS in your area, and that's not necessarily going to be easy. You'd then have to find out what sorts of connectivity and services the system provides, figure out which of several semi-incompatible networking protocols it uses, come to an agreement with its owner/operator to make use of it, etc.

HF packet (e.g. PACTOR, or AX.25 using a slower bit rate) helps to some extent, as it can be used over long distances where there are no local 2-meter/440 nodes. However, it's even slower and is subject to HF propagation issues.

Maybe so, maybe no.

Remember, the FCC rules generally require that you (the amateur) be in control of your station. Even if you use automatic control, you're responsible for making sure that you do not interfere with other amateurs' communications.

Also remember that there are legal rules concerning what sorts of transmissions you can do... nothing "for profit" may be of concern.

PSK-31 is a digital mode that works quite well on HF. Most people I have talked to about it keep their rig throttled down to about 30 watts when in this mode.

While packet is an interesting mode to experiment with, I do not think
it will work well as a sole access to the Internet.

A national dialup provider with local numbers in the places you
travel, would be best as a primary Internet access.

Happy trails,
Gary (net.yogi.bear)

Are you trying to keep in touch with hams or non-hams?

If non-hams, ham radio won't help much here. Phone patches are pretty much a thing of the past.

Your best bet in contacting non-hams through ham radio may be simply to join some of the traffic nets on SSB or CW, and pass messages to the outside world through the nets, but that's a little laborious.

A computer with email might be much better for contacting non-hams. There should be a lot of places on the "road" where you can hook up temporarilly to the Internet.

There may be wireless Internet hookups, too, but I'm not real sure...

For staying in touch with hams, you have a lot more options. Yaesu, Icom and Kenwood all make small multi-mode radios that give you coverage of all bands from 160 meters up through 440 mhz. See their web sites. Combined with a screwdriver antenna on your RV, you can work the world -- see the High Sierra web site for the latest on screwdriver antenna technology -- "screwdrivers" are pretty much the best way to go now, mobile-wise.

A few compact, 100-watt, multi-mode RV-appropos radios to look at:
Icom 706 series
Yaesu ft-857 series
Kenwood 480 series
Kenwood ts-2000 series

Hi all,

Hoping someone can help me get out of this noisy mess I'm in with my Yaesu ft-416 handheld.

Seems the squelch is constantly staying open - the knob has no effect. I figure I managed to hit some key combination inadvertently, as it's got tons of hidden little functions, etc. The reset trick (MR + VFO + 2) has no effect either.

Thanks for any help you can send my confused way.

73,
Gary

HF Mobile is not very reliable. I operate HF mobile voice, primarily on the County Hunter's net. The bend in a road is sometimes enough to drop from readable to unreadable. I realize that in digital modes, the signal gets through when voice doesn't, but there will be times when you can't reach that one place you desire to reach at that time.

Once you settle down, changing bands and frequencies may not be much of a problem, especially if you non-mobile antennas at your campsite.

Good luck
and 73

It's a great radio that works as good or better than some of the big ones.
I always get and easy 100W out. The radio is very versatile with many bells
and whistles that work.

I don't own one myself but I have a friend who does and he runs it mobile
and really likes it.. We've used it a couple of times in his shack and out
at events and it's always done very well.. I like the way it's setup and
operates.. The DSP controlls even work pretty good.

Source record: 16876

The display shouldn't be too expensive.....probably around 20 dollars. I am not sure how hard it would be to put in. Usually, there is a metal frame around the LCD that has ears on the back side of the display board. When you straighten out the ears, you can carefully remove the display. This is a conductive rubber strip that electrically couples the display to the circuit board. Be careful so that you don't touch the contact points. It would be a good idea to clean the rubber contact point with alcohol, afterwards applying a contact preservative such as Caig's Pro-Gold. I do have one of these rigs.....it works just as good as the newer ones. Many of the new rigs also meet Mil Std 810 for mechanical shock, as does the Yaesu 2400, but the reason that I like the 2400 is because this is the same radio as the land mobile version in the Vertex line. The Yaesu FT-23R was the same type of radio. This means that the radio was designed to meet its specifications across the whole 138 to 174MHz band, both transmit and receive. I would fix it if it were mine.

Here you go http://www.mods.dk/view.php?ArticleId=3053 It is a common
battery that should be available at Radio Shack. Might even find it
at Wal-Mart.

I agree with "Sky King", my recommondation for a does-it-all "RV transceiver " is the unique FT-847.

http://www.universal-radio.com/catalog/hamhf/1467.html

It's larger than the current crop of very popular mobile xcvrs like the IC-706 which were designed for underdash installations. But RVs are usually not as cramped for installation space as are cars & small trucks so an FT-847 would likely "fit"OK. The major advantages of the 847 vs. the mobile rigs include a far better receiver front end (overload & intermod) and ease of operation (much less "menu dipping"), among others. It's basically a complete full-blown home desktop station in a very compact package vs. the collection highly compromised mobile rigs out there today.

I'm an old fart hard-core HF dxer and CW dx contester and was inactive for 25 years who came back to the hobby just a few years ago. I'm very demanding when it comes to topics like receiver performance and operating flexibility/convenience. I wanted a compact and lightweight but not miniaturized rig for portable operations. With jaundiced expectations about it's performance after reading all the reviews and such I bought a new FT-847 a couple years ago.

When I first got it on the air during a Field Day operation I quickly concluded that it was a diamond in the rough. Except for it's rather dismal selectivity it perforned far beyond my expectations and my jaundice evaporated. Particularly since it only cost me about a third of what I would have spent on a "real" HF xcvr. From there I fixed it's selectivity problem by installing eight-pole 400 Hz and 2.1 kHz xtal INRAD xtal CW & ssb filters. The addition of the filters dramatically

changed the whole character of the thing and turned it into a real gem.

http://www.qth.com/inrad/

The two filters cost me $310 bucks <grunt!> on top of what I'd already paid for the radio but now I'm absolutely convinced that I've managed to come up with the biggest bang for the buck rig out there today.

847 Modes: CW, AM, FM, ssb, satellite, all digital modes via a computer, 12 bands 160-440 out-of-the box plus 60M with mods. Simple null modem cable between the radio and the computer and done.

The two most common HF digital modes are RTTY and PSK-31. Pactor and packet are out there but are nowhere near as commonly used as RTTY and PSK-31.

http://www.aintel.bi.ehu.es/psk31.html

Depending on who you'd like to stay in touch with while you're on the road my take is that you're pretty much stuck with a cell phone based on it's much higher reliability compared with any ham radio mode/band. At this point in history "traffic handling" via ham radio has all but died. The Internet has eaten it.

In an RV installation, there may not be sufficient air circulation
around the rig.

It would also makes sense to add extra cooling fans for the space
where all this is installed, essentially the way that rack mounted
electronics have a second level of cooling fans beyond what what each
component has.

You cannot run electronics too cool.

Happy trails,
Gary (net.yogi.bear)

Spammo. What a telling address. Well Mike, I love to help people, especially folks that actually need a bit of assistance. I do not care for those who will not make any effort to help themselves. Do you really think it too much of a burdon on that "rhythmguy" for him to open his manual and look up "lithium battery replacement"? Perhaps for today's generation it may be too much to ask of them, God knows they have literally been given everything without effort on their part. Hell, here in the United Socialists of America we even give away Amateur Radio Licenses', however in this case I think 'ol rhythmguy is just too lazy to reach out and get his no code, no effort, free ride down the Ham Waves.

Depends on how/where the equipment is installed.

> It would also makes sense to add extra cooling fans for the space
> where all this is installed, essentially the way that rack mounted
> electronics have a second level of cooling fans beyond what what each
> component has.

If xcvrs are installed in open-air spaces like under dashes or on
desktops, which is usually the case with ham rigs in RVs there
shouldn't be any particular need for additional fans. My 847 internal
fan very seldom kicks in when the rig is used on a desktop even when
running high duty cycle CW and I don't see why the fan would run any
more in an underdash installation. But stuff any 100W xcvr into some
close-fitting blind cubbyhole there better be a second fan which forces
air through the cubbyhole "or else".

> You cannot run electronics too cool.

I could not agree more - but within common sense limits.

I have a Simpson 269 VOM that needs a battery. It has one 1.5v battery (which is OK) and a space for another battery. This second space is larger than normal 1.5 vold batteries. The meter had a 22.5 volt battery in this space (it was dead); the battery made connections but did not look like the right shape for the compartment.

Anyone know what battery is needed? Anyone know where I could find a manual for the meter?

It is a beautiful meter and offers 100,000 ohms/volt for DC measurements.

And, since the meter is designed to continue to work until the battery
drops to a low level, I tried using two 9V batteries in series (18V).
It works.
I may have to replace the 2 batteries more often (Tho', after 3 years
they continue to serve me well). But, then, they are more readily
available and less costly.

YMMV

1025. IC-736 mic input question

Newsgroup: rec.radio.amateur.equipment
Date: 2005-02-25 17:33:59 UTC
From: behr@muir.math.niu.edu
Message-ID: <cvnni7rcm1@news.math.niu.edu>
Source record: 16798

I'm struggling with poor TX audio quality on my Icom 736, bought used several months ago. The mikes I use (an included HM-35, a homebrewed preamped mike, a Radio Shack amplified mike) all get reports of audio with no lows, pinched, not terrible but worse than from other similar radios (e.g. an IC 735 with the same HM). It might be good for pileups, but it's uncomfortable for normal ragchewing.

I've read a lot about insufficient mike gain in older Icoms, and about the possibility of plugging into the acc socket in the back. But I'd like to first determine whether my mike circuitry might have a problem.

I put a scope on the mic in and mic gnd pins of the connector, and on top of the normal 7 or so V DC (for electret biasing) I see an almost 1 V p-p sine wave, about 110 kHz, and very "noisy". The trace gets clean and sharp after shunting the mic ground to the regular chassis ground with a 10 nF cap. It's there whether the mike is plugged in or not, and whether the radio is receiving or transmitting.

This high frequency signal should not interfere with the audio, but who knows. It might also indicate some other problem, e.g. the built-in switching supply bleeding noise into the rest of the radio.

I haven't noticed any other glitches with this rig whatsoever. I do not have any excessive birdies from the PS. So I'm looking for ideas/opinions. Ideally, some kind OM with a 736 might be able to see whether his has that strange signal on the mic input too, in which case I could rest assured that it isn't unique to my radio.

Thanks a lot in advance for any hints or advice. 73, KC9DUX

From: John Franklin <jpfrank@peoplepc.com>
Message-ID: <2qKTd.14822$x53.6171@newsread3.news.atl.earthlink.net>
Source record: 16799

For sale Yaesu FT-7800R. Dual band 2M and 70 CM FM, with touch tone mike and 1000 memories! This rig is in excellent condition, no scratches/ding/marks. I am a non smoker and this radio has never had the mobile bracket installed on it. Asking $210.00 plus the reasonable costs for priority post shipping. I figure this to run about 3 1/2 pounds for shipping weight. If interested email me and I will send you a pic of this rig.

Have you tried a different mike on the same rig?
Might be a cable/shield problem, loose connection or a fubar'd
element. (it's usually a fubar'd cable)
I built my own mike out of junkbox parts for a 735, seems to work
OK..uglier than sin though!
G'Luck!

From: Stephen Cowell <scowell@sbcglobal.net>
Message-ID: <E8QTd.57449$iC4.10421@newssvr30.news.prodigy.com>
Source record: 16801

I was reading a review of my radio and was suprised to see that
the beacon feature could be used as a 3-message contest keyer...
I have since found that this is not the case, at least as far as my
skills have taken me. The manual is not a lot of help... I can never
get access to Beacon Text 2 or 3, even following directions.
Has anyone else tried this with this radio? Is it truly messed up
from the factory, or am I doing something wrong?

-NOTICE-

The "PileupBuster.com" domain name is For Sale.

For less then the price of an HF rig you can own the ultimate Ham Radio domain name.

The PileupBuster.com domain has immediate name recognition to everyone associated with Ham Radio. Plus, the sales and marketing potential of this name is unlimited.

The minimum offer on this domain is $1,250.00 (US Dollars). The PileupBuster.com domain name will be sold to the person, company or group that makes the highest offer. International offers are welcome.

This is a Private Auction. No one will see what you offer and you will not be able to see what others are offering.

You may begin submitting your offers on Saturday February 26. No offers will be accepted after 12:00 midnight (Pacific Time) on Friday March 4, 2005.

TO MAKE AN OFFER, GO TO: http://PileupBuster.com When the web page comes up, look right under the PileupBuster.com name. You will see "This domain is For Sale" then click on: "More detailsï¿½" You will then see a box to enter your offer. Enter your offer and then click "Make Offer"

This sale is supervised and regulated by SEDO (sedo.com), a highly respected International domain sales company.

If you have any questions, please feel free to contact me at: erfurth@gmail.com

Good luck.

73s,

Bill

Yes, that signal shows up with 3 different mikes, or with no mike
plugged in at all... It's definitely from the radio. Thanks - E.

Once you've pulled up menu #11, "Beacon Text", use the
main tuning knob to select text 1, 2 or 3.

If that dosen't work, join our group of nearly 2,000 FT-857
owners for more help.

Nice antenna, designed after the UKSMG design that
I
"borrowed" (tee hee) from GW0WFH.

http://www.uksmg.org/longwire.htm

This is a great working antenna, with 12dB
measured gain over a dipole. It isnt a beam, but
it sure is better than a dipole!

$150.00 plus $6.50 shipping in lower 48 states.

Email N8WWM@arrl.net for more information and
photos. I'll take paypal, a check, money order,
whatever.

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

Icom 02AT with wall wart.
Icom BC-35 plus extra Ice brick battery $ 65

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have several Scsii hard drives, and a Scsii CD changer.
No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

I recently had the same problem on an older Icom dual-bander mobile
rig -- the repairman replaced the potentiometer (the variable
resistor) the squelch knob was attached to.

If all else fails -- if it isn't any of the rig's software programming
functions -- it may be the little pot the knob is operating.

(Of course, you've made sure the knob is screwed tightly to the
pot...)

Hey guys,
I just got a new to me UV-3.
The radio has some minor issues and I need to talk to someone that knows the radio.
There is a little board, just to the left of the Phase Detector / Reference board
One of the wires are off.
Can anyone help me?

1065. Re: Which will be better TS 570 or TS 480

Newsgroup: rec.radio.amateur.equipment
Date: 2005-02-28 05:31:43 UTC
From: Kevin & Natalia <sparc_man@hotmail.com>
Message-ID: <4222a770$1@news.iconz.co.nz>
Source record: 16838

It will most likely depend on what you want to use the radio for, mobile, or desk (with a little portability)
The TS-570 will take up a good amount of room within your vehicle. In most cases it is not suitable for most of today's vehicles. I have a TS-450, and it does not fit very well in my Toyota Landcruiser, and it's got some spare. The TS-480 however will fit nicely. It also has a remote face (standard), which allows you to fit the main unit else where in the vehicle. In my view a much better radio for mobile use. I am running one for this main purpose.

They each have there own positives and negatives, it will all depend on your end use. Over all they both will do what any ham will want to do, talk around the world.
Power, and features are about the same.

I would suggest that you go to www.kenwood.net and download the manuals for both, and compare.

Best of luck.

Kevin, ZL1KFM.

-------- Original Message --------
Subject: [Amps] FS:DENTRON CLIPPERTON V 2meter amp- JUNK!!!!!
Date: Sun, 27 Feb 2005 13:48:40 EST
From: JimMoci at aol dot com
To: amps@contesting.com

I have for sale a Dentron Clipperton V 2 meter amplifier rated @ 500 watts input with a 4CX250B. It is in pretty good cosmetic shape except for a small
ding in the left corners. As far as working condition goes it does work but I
think this amp is a piece of junk! (Hey I am honest) It has an LC tank circuit-
it is not a stripline design like it probably should be @ 2 meters. It runs awfully hot and has a severly under sized blower. The tank circuit is under sized and runs very hot- so hot that it melted the solder running 200 watts FM. At
300 watts out it runs fine on SSB but I think it is still way to hot. These junkers are going for $600-700 on Ebay. Why? I dont know why but my guess would
be a solid state 300watt amp is $700 and you still need an Astron RS70 to run
it. I think it would be fine if someone installed a much larger blower but that would require hacking the cabinet which would ruin the collectability of
the amp. At least it would be functional and reliable then. Better yet would be
to convert it to stripline- there is enough room with some cabinet work and hacking. It would also be an excellent candidate for a six meter conversion where a conventional tank design is usable with a 4CX250B. I would like to sell
this Denny Dentron junker -boatanchor for $550 to someone who can appreciate it
for what it is!! :)
Thanks & 73, Jim W3ATV

It is a good amp, if you use it to its rated output.
The 4cx250b is only rated for 250w plate output. Trying to get more from
that tube will shorten life, and produce much more heat.
I have used that amp running at 150w out and it just gets warm, and it
is solid performer.

1078. recovering a factory set repeater split on a Yaesu VX-5R

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-01 05:29:17 UTC
From: tom <cyberhun@shaw.ca>
Message-ID: <N4TUd.531015$Xk.365232@pd7tw3no>
Source record: 16751

I've read the manual and online resources about repeaters and it doesn't give me the answers I'm looking for.
This HT is billed as having a 'dual VFO'. I assume 'VFO' means Variable Frequency Oscillator (although the manual doesn't spell it out). I think basically this means that it can reference and increment and decrement 2 frequencies seperately, so that it can do stuff like operate on one channel while scanning other channels in the background and stuff like that. Also, I think having dual VFO enables it to use repeaters that use 2 frequencies (uplink and Tx) because obviously a repeater can't transmit on the same frequency that it's listening on, because it would just amplify itself.
The manual for this HT says that there are 6 frequency bands that are designated for use by repeaters in North America:
145.1-145.5 (uplink frq is 600k down),
145.6-145.8 (uplink frq is 600k down),
146.0-146.4 (uplink frq is 600k up),
146.6-147.0 (uplink frq is 600k down),
147.0-147.4 (uplink frq is 600k up),
147.6-148.0 (uplink frq is 600k down)
and the manual says that the HT is pre-programmed, at the factory, with these split-frequencies and they are activated by turning the 'Auto Repeater Shift' (ARS) function on.
All of the repeater bands are properly set, with the correct, 600k, split (up or down as the case may be) --- except for 145.6 to 145.8 which is simply not there, and when tuned to this band the unit operates in simplex mode even with ARS turned on. All of the other repeater-designated bands (when ARS is turned on) show the split frequency icon and operate in the proper split frequency mode when tuned to those other designated repeater bands.
When I tune to the 'missing' repeater band and put in a split, it doesn't 'stick', as soon as I tune away and come back it is gone. I've read the entire manual and I can't see any way to set a repeater split over a range of frequencies. I can program single 'odd split' frequencies as laid out on pg 42 of the manual, but that consumes 2 memory channels, works only for a single dual frequency, and to do the whole (145.6 to 145.8) band would consume all my memory slots. If both VFO A and VFO B are tuned to the same band I can 'link' them together and tuning one up or down moves the other up or down also, but this is obviously meant to be temporary because this setting disappears as soon as one of the VFOs is tuned outside of the band.
So my question is: how can I recover the 'missing' repeater-set band(145.6mhz to 145.8mhz), which is supposed to be factory set to a negative (repeater uplinks on a frequency less than it transmits on), 600khz split?

1089. Re: What equip to buy?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-01 17:49:44 UTC
From: JB <ac6tk@cybertime.net>
Message-ID: <d02a0a$1suv$1@madmax.keyway.net>
Source record: 16762

I'm happy with my TS2000x. I normally run it from either the shack or remotely at the office from a laptop. I have extended a mic and speaker there. It actually allows me to make adjustments from either point, as all of the controls make software adjustments. Vol, Sq, whatever, it doesn't matter. If I touch the remote control it takes over control. If I touch the face control, it takes over. So you can have the radio mounted in the back at a comfortable position with a Multi-mode controller and keyer, and a control head up front. I have not tried dual control like that with the remote head though, but it controls from a dedicated RJ45 serial port alongside the RS232C PC port. I have used the radio mounted up front in the van from a laptop back in the trailer, but not for CW.

Oddly enough, there is only one transmitter active at a time, although it has a main and sub-band. But if you have packet or pactor on one band unit, you can still operate on the other band, as the TNC will wait until you are finished talking before sending a packet on the other band. Just the ticket for APRS on the road. It has a built in packet TNC for DX cluster, and it is usable as a packet station but I have never used it as I had a PK232mbx from the start.

The only drawback is 2.6 amps in RX Squelched! This seems high for a rig on batteries, but it is great for a coach with either Solar or autostart generator. I suspect the DSP and controllers are always active and this will be the norm for most new rigs with bells and whistles. It brings air in from under the front panel and out the rear around the cables and all heat sinking is internal. Because of this, the fan will kick on even in RX.

Thanks Buck. You sound like you know what you're talking about. I never noticed how many of these ham antennas there are until I got into amateur radio and started looking around (I don't have my callsign yet, I'm still waiting for my test results to be processed). There's almost one every couple blocks!
Do you know if there is a way to do lookups on the ham callsign database by asking if there is an entry for a certain address? Or is it just by name or callsign? The one page I found for doing lookups only takes callsigns and names.
Maybe I could download the entire info file from industry canada and either use a script to eneter it into mysql or just do a string search on it.
Hmmm. Maybe I could just go knock on the guys door.

Fear not, my gracious lady --- I am several thousand miles distant, in a
far-away foreign land where amateur radio enthusiasts who have never met
before have an exceedingly bizarre custom of responding to each other in a
civil (and sometimes even, gasp, friendly) manner.
Is Toledo like some kind of urban hell where you're besieged by degenerate
crack-zombies, or something?

1105. radio-signal transmitting device that activates remote control, dog-punishment collars

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-03 17:36:15 UTC
From: tom <cyberhun@shaw.ca>
Message-ID: <jWHVd.564250$8I.322987@pd7tw1no>
Source record: 16778

I have a friend who hates dogs (was badly mauled as a child I think) and is building a radio-signal transmitting device that activates those electric, remote control, dog-punishment collars, and sets the voltage way high, too (some have more than one power setting). Even though there are multiple models, they all work on the same frequency (he says) and the transmitter he's building will work in conjunction with a 1000watt (pep) amp through an antenna that is mounted high on a mountain with the main lobe aimed at a nearby city of 2 million.
I don't know what to think about this guy. Is it possible for this thing to work at all? Then he says he has plans to beef up the amplifier and shock dogs all over the eastern seaboard.
Not a joke.

The Kenwood is a bit larger, IIRC, 200 channels, can do 6W VHF, 5 UHF
with 13.8V. Frequency range for RX seems about the same - no, I take
that back, the Yaesu has 200 mhz. The Yaesu has 1000 channels. I just
picked up the 60 yesterday, too soon to make a decision / expert
opinion.

> PS: Does the FT-60 have computer programming capability?

Yes.

Either the FCC database for the US, or the ARRL lookup, or the QRZ
database, will allow you to sort by town or postal code. Our radio
club had gotten an address list of all of the licensed hams in the
several nearby communities.

Joining a local radio club may also help.

Happy trails,

There is, but I can't find it right now. I think it's buried
somewhere in the FCC. You can enter a location and ask it to give you
every license with X miles. Can't remember if it only gives ham
licenses or not. I used it one time to make a list of all hams within
a couple of miles of my house. I'll do some more looking.

Yes, but Who is going to put all thoes dog collers on the dogs?

(you can buy this stuff already on-line)

>Then he says he has plans to beef up the amplifier and shock

He will have to put on 150 million more collars, each would take 10 min, how
many years is that anyway.
Easier to shoot the dog with a bullet, cheaper too.

Thanks, Dick, but I guess I should have mentioned that this location is in
Canada, sorry.
I looked at the FCC site too, but I could only find a way to do lookups
using names or callsigns, no lookups using addresses, like the Industry
Canada site.

>I don't know what to think about this guy.

I think he's trying to do something which is more than a bit
ill-considered, as well as nasty, certainly capable of causing pain to
dogs who never did him any harm at all, and possibly capable of
causing innocent people to be hurt (what if a touchy dog goes berserk
as a result of being continually shocked at a high setting, and bites
or otherwise injures someone?).

I think he ought to find a healthier way to deal with his dislike of
dogs. It might save him from having to face a big fine from the FCC,
and lawsuits from dog owners or other injured parties.

> Is it possible for this thing to
>work at all?

Not, I think, in the simplified way you are suggesting that he's
talking about.

For one thing, these devices do not all use the same frequency. I
checked the FCC Part 15 registrations for the remote collar
transmitters sold by Innotek - many of them use 433.92 MHz, but there
are other frequencies used as well (295.0 and 318.0 MHz).

The first of these frequencies is a commonly-used ISM-band frequency
which is used by many license-free devices, including garage door
openers, wireless outdoor thermometers, and so forth. Imagine the
interference he's likely to cause if he tries this stunt!

There are a bunch of other technical problems with what you say he's
suggesting. I won't go into details.

What's more, using this transmitter would be a violation of several
FCC rules and regs even if he has an amateur license (it would be
"broadcasting" which is specifically forbidden). If he doesn't have
an amateur license, more the worse for him!

> Then he says he has plans to beef up the amplifier and shock
>dogs all over the eastern seaboard.

... and if he does that he'd probably exceeding the 1500-watt legal
limit and setting himself up for another violation.

What's more, I think he's greatly underestimating the effective range
of such a system, even with a kilowatt. Those remote training collars
are deliberately designed to have a limited receiver sensitivity, so
that one person's transmitter doesn't zap dogs down the block and so
that they're less likely to be false-triggered by other ISM-band
transmissions. Add to that the fact that 433 MHz signals are very
much on a line-of-sight-plus-reflections basis, and even a kilowatt
isn't going to give him significant coverage out past the radar
horizon.

>Not a joke.

Just a really bad idea, I think.

In article <jWHVd.564250$8l.322987@pd7tw1no>, cyberhun@shaw.ca says...

<snippety>

> I don't know what to think about this guy. Is it possible for this thing to
> work at all? Then he says he has plans to beef up the amplifier and shock
> dogs all over the eastern seaboard.
> Not a joke.

First and foremost: If you truly consider him a "friend," you
should at least try to convince him to seek professional psychiatric
help, post-haste.

Second: Even if this whacko scheme does work (and I doubt it will,
because he'd have to find and successfully duplicate the specific type
of modulation that activates the collar), he's setting himself up for
MAJOR trouble from federal authorities (specifically the FCC).

It doesn't matter if he holds any sort of radio license or not --
If he does as you describe, he will be committing a felony, one that can
land him in federal prison for a minimum of ten years (and with a signal
that strong, he'll be ridiculously easy to DF).

To be perfectly honest, this sounds like the meanderings of a
seriously deranged mind bent on some silly idea of revenge. Whoever this
is really, REALLY needs to seek professional counseling. Quickly.

Something you can't get from documentation is "usability" or ease of use. Historically, I have found Kenwood to feature a much more user friendly menu system compared to Yaesu. In part, I was looking for comments in this regard, as well as other "feel" type opinions that one can't get from looking at a picture.

You have to understand the motivation behind mopey's forges. Keyclowns are desperate people...they do not have the mental faculties to tolerate being bugged about their keyclownism. It makes them upset because they have to hear dissent. Steveo is the poster child for this attitude. He simply cannot take it when somebody gives him crap about being a keyclown.

This atttude has no doubt been developed by a lifetime of crying and whining to get his way. It started in his childhood, when he whined and cried in supermarkets and malls to get candy or toys. When his parents indulged him in these situations it reinforced the idea in his young mind that if he yelled and cried to get his way that he should always get it.

As he became a young adult and found that life had to be met on life's terms, not his, he railed at the injustice of it all. Teen years immediately before this stage found him in a constant state of barely controlled rage and often acting out in his frustration. Typical of such incidents are punching people who cut him off in traffic, yelling obscenities out car windows, and showing no consideration for others.

Such is the mentality of a keyclown. RF spectrum, to a keyclown, is nothing more than a wide open space to play in. If this were a private yard or a public place belonging to all taxpayers, the evidence of keyclownism would be obvious. The place would be uncaringly trashed with garbage and the observed attitude would be "So what if it is a mess, you wanna MAKE me clean up after myself, sucker?"

The visits to peoples' homes are an expression of this frustrated, thwarted, angry personality. Steveo tries to make someone conform to his ideas of what should be in the NG by making threats and visits. To Steveo, the worst thing on earth would be if the AKC knows his address, and his logic is that him knowing AKC addresses should strike fear in their hearts. You see, when he visits with his 12 gauge digicam the AKC should shake. They do...with laughter.

The fact that Steveo shows himself to be a disturbed individual in these visits does not dawn on him. This is because he is not inhabited with the normal sense of right and wrong. His opinion, like that of all keyclowns, is that whatever he wants to do is OK, and if someone disagrees then he has the right to attack them, physically or otherwise. This affliction is commonly called a sociopathic disorder.

The very fact of posting this message will bring a barrage of name calling, threats, and other things that keyclowns believe are effective. They think they are effective because they are effective at riling THEM up. This attitude is consistant with keyclownism's main root causes: the fact that keyclowns are only aware of what they want and have no concern for others, coupled with a total inability to tolerate even the most basic forms of disagreement.

The reactions to this post will prove the thesis as presented. Keyclowns are simple creatures, and always behave in a predictable manner.

1133. Yaesu FT-50R transmit below 140 MHz ??

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-05 07:41:59 UTC
From: Everett <news.20.038099@spamgourmet.com>
Message-ID: <wxdWd.6100$s_.3276@fe07.lga>
Source record: 16706

I have a FT-50r and love it. However, the US Coast Guard Auxiliary is moving to new frequencies in a couple of months, including one simplex frequency at 138.xxx MHz. My serial number starts with 8l3 and I can't manage to transmit below 140 MHz. I've done the MARS/CAPS mod (removing the solder bridge) as well as unsoldering resistor #1, with appropriate resets, to no effect.

Anyone have any experience in this area?? I'm approved on this frequency but can't get to it with this HT. I also have a VX-150 that works fine but I'd like the capabiltiy on the 50r also.

Thanks,
Everett

Teen years immediately before this stage found him in a constant state of barely controlled rage and often acting out in his frustration. Typical of such incidents are punching people who cut him off in traffic, yelling obscenities out car windows, and showing no consideration for others.

Such is the mentality of a keyclown. RF spectrum, to a keyclown, is nothing more than a wide open space to play in. If this were a private yard or a public place belonging to all taxpayers, the evidence of keyclownism would be obvious. The place would be uncaringly trashed with garbage and the observed attitude would be "So what if it is a mess, you wanna MAKE me clean up after myself, sucker?"

The visits to peoples' homes are an expression of this frustrated, thwarted, angry personality. Steveo tries to make someone conform to his ideas of what should be in the NG by making threats and visits. To Steveo, the worst thing on earth would be if the AKC knows his address, and his logic is that him knowing AKC addresses should strike fear in their hearts. You see, when he visits with his 12 gauge digicam the AKC should shake. They do...with laughter.

The fact that Steveo shows himself to be a disturbed individual in these visits does not dawn on him. This is because he is not inhabited with the normal sense of right and wrong. His opinion, like that of all keyclowns, is that whatever he wants to do is OK, and if someone disagrees then he has the right to attack them, physically or otherwise. This affliction is commonly called a sociopathic disorder.

The very fact of posting this message will bring a barrage of name calling, threats, and other things that keyclowns believe are effective. They think they are effective because they are effective at riling THEM up. This attitude is consistant with keyclownism's main root causes: the fact that keyclowns are only aware of what they want and have no concern for others, coupled with a total inability to tolerate even the most basic forms of disagreement.

The reactions to this post will prove the thesis as presented. Keyclowns are simple creatures, and always behave in a predictable manner.

Look here:

http://www.packetradio.com/

and check out the RASCAL.

Any of the sound card interfaces set for packet, rtty, psk31 should work
fine for sstv. If you need software go here and look for mmsstv. It is a
free sstv program.

Which of these would be the most useful to the Radio Amateur? Also when deciding upon one or the other, what specs should one look for in purchasing one for Ham radio applications, given basic needs for now but with enough capabilities to handle more advanced Ham radio needs in the future? Thank you for any help. B. Taylor

Also try http://home.att.net/~n8st/. Good quality, easy to
set up, just plug in. Same price as Rascal I think, $40.

Dan, W9FCC

If you have to ask then you don't need either one.

It depends on what you want to do. I have several scops around the house
and don't use either of them very much. I have had access to a SA and have
used it very little.

Scopes are most useful at audio frequencies and the SA is good for RF
applications.

Hi B. Taylor,
You really are asking the proverbial "how long is a piece of string"
question.
Might I suggest you spend some time and money on a
good electronics course.
If courses are not offered in you area try your local library,
Is their someone who can mentor you?

I would buy both of them. An oscilloscope is something you really need for doing signal tracing, etc. while a spectrum analyzer is a must if you are doing synthesizer/oscillator/transmitter design. I have both of them and use them all of the time. Other good things to have are an RF power meter, modulation meter, frequency counter, broadband noise source, RF generator, DVM, VOM, and a good variable power supply. This just scratches the surface, depending on your needs.

Pete

If you just want a cool toy, get a scope with a FFT function.
You'll be the envy of all your ham buddies.
Got a nice one for sale here:
http://nm7u.tripod.com/homepage/sale.html
Priced at 25% of what you'd pay at a dealer.

The choice between the two depends on what you are most interested in
doing. Since both these instruments are designed for different tasks.
However if you are looking for a good all purpose Swiss Army knife sort of
tool for general ham useage, I would look at a gadget called a service
monitor. Depending on make and model, you can find one that combines the
features of most of the instruments on Pete's list :) They usually have a
scope that will do af and also act as a spectrum analyzer along with power
meters,signal generator,frequency/modulation meter perhaps a DVM etc. All
in one handy dandy portable package.

Here is an example of one of the many on Ebay at present.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=97198&item=878428871&rd=1

As a general purpose test and troubleshooting tool I find these hard to beat!!

I have an Algreo DFjr doppler direction finder for sale. The unit is in excellent condition and has antennas cut for 2 meters. It also includes the mulitport adapter and manual. This is a very cool device that also interfaces with GPS and APRS programs such as the PocketAPRS.It is great for foxhunting or finding interference. Asking $400 including shipping

Please email directly if interested.

1164. (BPL) Virtual Spectrum- Global Test

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-06 16:34:16 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <ciGWd.56696$uc.21664@trnddc03>
Source record: 16737

I finally got the Provisional Patent filed for
my BPL work-around, Virtual Spectrum (tm).
Server is up and running and everything is ready.
Next step- some friends will
help with tests- one in Europe, one in
Australia and two in the U.S.
There will be a low bandwidth and
a high-bandwidth trail. First will
stream a few KCs of 40 meters and include
several CW messages at various frequencies,
including a couple close together so we
can figure the best levels without cross-talk.
Next will be a high-bandwidth trial with
CW, SSB, FM and some other mode yet
to be decided, streaming about 40 KC of
the band. Then, a live, continuous
stream of the bottom 40 KC of 20 meters
from my location, which will run for a few days.
I hope they don't put BPL here in the mean time.

After these tests are concluded,
the next step will be configuring for
2-way QSOs, which is just a matter of
setting up the software and T/R switching.
I ain't had this much fun with a radio project
since I was a novice. :-).

Source record: 16739

They are both useful. You don't even want to know about all the bells and whistles you can get, let alone trying to figure out how many of those whistles you can use, not to mention the bells. And the digital models are like a high end ham rig. You are going to be navigating tonnes of menus.

I'd go for an analog crt based scope, 20mhz, 50mhz or 100mhz bandwidth. With a 50volt to 50millivolt input range. Make sure it comes with a probe with 10:1 input switch. Scopes typically have a 1meg ohm input impedance so the 10:1 would get you 11 meg input plus the probe offers frequency compensation.

> around?

Alas I am not aware of such an item. But there maybe someone else who
does. :) Heathkit made anumber of these in kit form for thier Amateur
Radio kit and you do see them on Ebay and other places. Designed for use
with the SB-XXX series mostly they do have specific needs as to IF
frequency etc. Thta info is easly available and using it, I'm sure they
could be adapted quite easily to othere readios that have similar IF's.

Scopes are very versatile instruments, and can be used for a number of
purposes right out of the box. The accuracy of results depends on the
"quality" of the instrument. Suitable setup and interpretation of results
will allow you to make Voltage (p-to-p and RMS) frequency, phase
measurements. Newer instruments have these built in and display them on
screen without the need to eyeball the waveform and do mental arithmetic.
Back in the day... the reason an electronics nerd kit included a small
pocket slide rule was to do quick calculations based on the observed
waveform and control setting :) While it was fun, I much prefer the newer
gear, with its on screen of voltage, frequency etc along with the
waveform. :)

For me at least the most useful peice of test gear is the service monitor.
Even if you are using it as test gear it can be used as receiver to tune
in local broadcast stations and send them annoying critiques of their
signal deficencies ;)

Thanks to all for the input, I really appreciate the help. The
Service Monitor idea sounds absolutely perfect! But I was wondering,
because it encompasses so many different instruments into one unit,
does the accuracy or capabilities of each unit suffer a bit, or is it
priced like that of a second home? Who makes a decent Service Monitor
between $3000 to $5000? I tried to follow one response to a link on
Ebay but the item had already expired. Thanks again to everyone.

Do a Search on Ebay for:

Service Monitor -Sony -"Computer Monitor"

That should get you most of what is currently available. Amkes that I have used include Cushman, IFR, Marconi, and Motorola. As for prices, your indicated price range should allow you to find a very suitable instrument. Look at options carefully. e.g. If the unit has cellular testing capabilities and you are not repairing or install such things, you really don't need the capability. But if you do a lot of HF work then having one with SSB capability would be a great idead :). For amateur radio and SWL interests one that does AM/FM/SSB would probably be ideal.

Good Hunting !!! And as with all Ebay transactions Caveat Emptor !!! ;)

A service monitor makes an excellent...service monitor.
It's a lousy scope.
It's a poor spectrum analyzer.
But it can be a GREAT service monitor.

Really depends on the depth and nature of your tinkering. Are you talking component level equipment building/modifying? A scope would be more useful than an SA. If you are talking about VHF/UHF system building/tuning or RFI investigations, etc, then perhaps a Spectrum Analyzer would be more useful.

However, I'd like to point out that you can get a good scope for less than 1/10th the cost of a reasonable Spectrum Analyzer, so if your budget allows for a Spectrum Analyzer, then you can probably afford a used but good scope, too.

Sony/Tektronix made a spectrum analyzer that was used with the
Sony/Tektronix 324 portable scope. I have the 324 portable scope, but I
don't have the analyzer. You can build a so called spectrum analyzer
from a kit that uses a scope for a display Science workshop sells one,
and Hans Summers built one using a small TV crt for a display but you
could use a scope as a display instead.

>
> Scopes are most useful at audio frequencies and the SA is good for RF
> applications.

A 350 MHz four channel scope is made for RF work and is a valuable piece of equipment if you fully understand how to use it. Some spectrum analyzers are made for audio frequencies. You need to understand the capabilities of the equipment you are considering, and what your application is. I used a Tek 2465 scope to test and align video boards for telemetry equipment with bandwidths up to 40 Mhz. Another useful instrument is a good quality true RMS voltmeter that reads to .01 dB to calibrate and balance detector/demodulators. I was offered a network analyzer for my bench but passed it to another tech. I preferred the harder jobs that didn't need it, and really didn't have room on either bench, or the three equipment carts for another large piece of equipment.

Your choice of test equipment depends on your skills and the design level of what passes your bench. I worked on telemetry used for tracking satellites, and the shuttle program. It was cutting edge and all built to order. If you are building a one of a kind wideband Ku band receiver for the space station you need the best equipment you can find. On the other hand if you just breadboard simple circuits you need less sophisticated equipment.

Additionally,, Tektronix made a seires of SA plugins for the 76xx series
scopes..
The 7L5 was the low frequency (audio) one and the 7L12 was the Mhz range..
Maybe they made them for other series scopes...

news:1109989304.846748.223490@l41g2000cwc.googlegroups.com...
You have to understand the motivation behind mopey's forges. Keyclowns
are desperate people...they do not have the mental faculties to
tolerate being bugged about their keyclownism. It makes them upset
because they have to hear dissent. Steveo is the poster child for this
attitude. He simply cannot take it when somebody gives him crap about
being a keyclown.

This atttude has no doubt been developed by a lifetime of crying and
whining to get his way. It started in his childhood, when he whined and
cried in supermarkets and malls to get candy or toys. When his parents
indulged him in these situations it reinforced the idea in his young
mind that if he yelled and cried to get his way that he should always
get it.

As he became a young adult and found that life had to be met on life's
terms, not his, he railed at the injustice of it all. Teen years
immediately before this stage found him in a constant state of barely
controlled rage and often acting out in his frustration. Typical of
such incidents are punching people who cut him off in traffic, yelling
obscenities out car windows, and showing no consideration for others.

Such is the mentality of a keyclown. RF spectrum, to a keyclown, is
nothing more than a wide open space to play in. If this were a private
yard or a public place belonging to all taxpayers, the evidence of
keyclownism would be obvious. The place would be uncaringly trashed
with garbage and the observed attitude would be "So what if it is a
mess, you wanna MAKE me clean up after myself, sucker?"

The visits to peoples' homes are an expression of this frustrated,
thwarted, angry personality. Steveo tries to make someone conform to
his ideas of what should be in the NG by making threats and visits. To
Steveo, the worst thing on earth would be if the AKC knows his address,
and his logic is that him knowing AKC addresses should strike fear in
their hearts. You see, when he visits with his 12 gauge digicam the AKC
should shake. They do...with laughter.

The fact that Steveo shows himself to be a disturbed individual in
these visits does not dawn on him. This is because he is not inhabited
with the normal sense of right and wrong. His opinion, like that of all

keyclowns, is that whatever he wants to do is OK, and if someone disagrees then he has the right to attack them, physically or otherwise. This affliction is commonly called a sociopathic disorder.

The very fact of posting this message will bring a barrage of name calling, threats, and other things that keyclowns believe are effective. They think they are effective because they are effective at riling THEM up. This attitude is consistant with keyclownism's main root causes: the fact that keyclowns are only aware of what they want and have no concern for others, coupled with a total inability to tolerate even the most basic forms of disagreement.

The reactions to this post will prove the thesis as presented. Keyclowns are simple creatures, and always behave in a predictable manner.

Does anyone have experience with a good (and preferably inexpensive)
fox kit that has a range of atleast 30 miles? I don't have a frequency
range in mind, and am open to suggestions. Any additional suggestions
regarding the best equipment/antenna to track it with is also
appreciated.

Thanks in advance!
Dave

1187. Motorola radios, Want/FS, etc.

Hi all,

Have for sale some UHF radios, etc, with Free Shipping:

Visar,
16ch, H05RDH9AA7BN, 403-470MHz, Looks NEW, not a scratch.
Sticker on back is blank...? Maybe a factory re-furb or similar, missing
dust cover, down-button for channels is flaky, mostly doesn't work, light is
out,
includes dual-slot charger and older but useful battery, works fine. $100.

M1225,
20/24ch, M44DGC90J2AA, Good condition with some dirt in seams,
bumps/bruises, minor key wear, works great, includes radio/bracket/mic,
NO bracket screws, sorry! $200

M120,
2ch, 16pin, M44GMC20A3AA, top appears to be a little sun-bleached, photo
looks worse than it is.
Includes radio only, $120

Maxtrac,
16ch, 5pin, D44MJA7DA5CK, sticky-tape, stickers, dirt, goo, cracks, etc.
Includes RADIO ONLY. Works fine. $80

Motorola RIB,
was cloning a bunch of spectras and it just died. Replaced 4 zener diodes
in it, and it was still dead. Found a good box with broken DB pin,
and harvested the DB25 connector from this box. Parts only or u fix. "B"
version, not the surface-mount board, regular components.
Bought it new from Monty about 6 years ago. $20 or trade.

STX,
800MHz, conventional/trunking, display/keypad, etc. I know nothing about
them. One side scratched/engraved,
H25STE5170CN
$BEST OFFER OR TRADE.

HT600,
Factory 6ch, H44SUV7160CN, like new DTMF front, case
and beltclip like new, very light name written on top over motorola sticker.
[Should come off with solvent, no problem.]
This is a true 9.5 of 10 radio including intact tags and dust cover.
Includes 'pocket' charger. $110

P200 VHF,
6ch, H43RFU7160AN VHF, 146-170MHz or wider, very light and small FD
name engraved with cheap pen on side, exc condition including intact tags
and dust cover.
Includes 'pocket' charger. $100

[NO PHOTOS on the last 2, they're truly not necessary.]

VOICEDUCER,
earpiece only, not the box. New, never used. OFFER?

***

Will consider late-model trades on useful Motorola or other items of
interest.

I need:

Kenwood TM-V7A programming cable.
Minitor III UPI.
Minitor III VHF 151MHz pager in excellent condition.
Stage/band/PA items (mixers, speakers, wireless bass, whatever)
Glock tactical light
Honda Goldwing stuff
or whatever....

Postal money orders or PayPal +2% accepted,
Free shipping for CONUS only.
email for payment instruction or questions.

Photo here:
http://www.sleepguides.com/auction/misc1.jpg

Thanks!
Randy

I would buy the highest freq. scope that you can find and afford if you are only allowed one of the two. A company called Texscan made a line of inexpensive Spectrum Analyzers for the cable TV industry that are showing up now on the used market and on eBay. For most Ham work they work great. The company that bought Texscan is called Trilithic and manuals can be gotten from them I have been told.

This is the best advice out of the whole bunch!

If you are just starting out with this kind of test equipment then a moderately priced analogue scope will serve quite well. It will also be under $200.00 or so. If you find you need more later on you can get something better. But that scope will probably do all you want it to.

You will probably get more use out of a scope than anything else. If you do any building of any logic or timing circuits, measuring ripple on a power supply or looking for signal paths of DC or audio, a scope is what you need. A spectrum analyzer will not do the things a scope will do.

A general coverage receiver will serve as a "poor mans spectrum analyzer". Most ham transceivers have general coverage on them and you can do a lot of things with the receiver that you can do with an expensive spectrum analyzer. Read frequency, measure levels, distinguish between different level signals (level of a harmonic compared to fundamental) etc. A spectrum analyzer is just an automatically tuned receiver with a display. The transceiver can also be used as a signal generator.

When you learn how to do those type of things with a receiver then a spectrum analyzer is much easier to use and understand.

Add the spectrum analyzer later. There are all different types and priced analyzers with many different features that you may or may not want. There are also some real dogs out there that you probably don't want.
Then the problem comes when buying of determining if it is really working as it should. It takes some experience with that kind of equipment to recognize if it is working properly. Repairs can be quite

expensive on a spectrum analyzer.

I would also avoid a service monitor as a first piece of test equipment.
As someone else said "they are a poor scope, a poor spectrum analyzer". They are a handy item for some types of things if you can get one that works properly. Like a spectrum analyzer they can be very expensive to repair. You really need to know what you are buying when you buy one.

I have a Kenwood TS-711A. I bought the SS-64 tone encoder from
Communications Specialists at http://www.com-spec.com/ss64.htm
They don't have installation instructions for the TS-711A.

I have 3 wires to hookup:

Red: v+
Black: Ground
Yellow: Modulator

The first two I can handle but the yellow I need help with...

I just received the service manual and schematics today but I still can't
find the modulator.
Does anyone know where to solder the yellow wire for tone out?

Thanks,

Doug

Doug -

You can call ComSpec Tech support.
They have hundreds of Application Notes on file on file.
They are slowly moving these paper documents to the Internet web site.

SS-64 General Product Installation Sheet
http://www.com-spec.com/insheet/ss64inst.pdf

The second page of the SS-64 highlights the CTCSS OUTPUT (YELLOW) (PIN 3)
This output generates the CTCSS encode tone. The most common place to connect this line is just prior to the modulation stage in the transmitter. Typical connections would be to the center of the deviation pot. to the varactor diode in the modulator circuit, or to the manufacturer’s suggested connection point. This connection point can vary from radio to radio. [A schematic of the radio is useful]

Do NOT connect the CTCSS Output to the microphone input as the microphone audio stages will distort and attenuate the CTCSS signal. Since the CTCSS Output on the SS-6.4 is tow impedance, you may have to install a series resistor to reduce the loading effects of the CTCSS Output depending on the interface impedance. This is evident in the case of connecting to the center of a 106K deviation pot. In this case, a 106K series resistor will

compensate for the impedance difference. In addition, a slight adjustment of the voice deviation may be required to compensate for the CTCSS Output circuit loading.

1200. Extreme Cycle Duty Orbital battery charging voltage??

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-08 07:53:17 UTC
From: denton <denton@oregontrail.net>
Message-ID: <112qmeu3p468n36@corp.supernews.com>
Source record: 16673

Hi all...
I have purchased a Extreme Cycle Duty Orbital 12-volt Sealed Battery as a replacement for an aging standard deep cycle lead acid battery that floats across the output of my 35 amp homebrew power supply with blocking diode (50 amp jobbie on heat sink).
I typically use 13.8 vdc on the outboard of the blocking diode to charge the old deep cycle battery to keep it up to snuff, but am wonding if I should change the charging voltage for the new battery.
Comments anyone?? Thanks in advance...

Doug -

You can call ComSpec Tech support.
They have hundreds of Application Notes on file on file.
They are slowly moving these paper documents to the Internet web site.

SS-64 General Product Installation Sheet
http://www.com-spec.com/insheet/ss64inst.pdf

The second page of the SS-64 highlights the CTCSS OUTPUT (YELLOW) (PIN 3)
This output generates the CTCSS encode tone. The most common place to
connect this line is just prior to the modulation stage in the transmitter.
Typical connections would be to the center of the deviation pot. to the

varactor diode in the modulator circuit, or to the manufacturer's suggested connection point. This connection point can vary from radio to radio. [A schematic of the radio is useful]

Do NOT connect the CTCSS Output to the microphone input as the microphone audio stages will distort and attenuate the CTCSS signal. Since the CTCSS Output on the SS-6.4 is tow impedance, you may have to install a series resistor to reduce the loading effects of the CTCSS Output depending on the interface impedance. This is evident in the case of connecting to the center of a 106K deviation pot. In this case, a 106K series resistor will compensate for the impedance difference. In addition, a slight adjustment of the voice deviation may be required to compensate for the CTCSS Output circuit loading.

Doug
Send that back to Com-spec and get the TU-5PX that's made for the
711/811 $60.00 and it's a simple plug-in

>Comments anyone?? Thanks in advance...

This appears to be an AGM (Absorbed-electrolye Glass Mat) battery, one
of the newer generation of deep-cycle lead/acid batteries.

I've done a bunch of reading on AGMs, and I've heard of some people
who've done months of reading and study... and the conclusion seems to
be that there's a lot of disagreement about the ideal charging regime
for an AGM battery.

Some people feel that using a standard fast-charger is fine, with
fast-charge voltages up to 14.5 or so. Other people feel that this is
a Really Bad Idea, and that AGM batteries should not be charged at
above 14.0 volts. Float voltages of 13.4 - 13.8 seem to be what's
usually recommended.

One of the nice things about AGM batteries is that they'll accept a
lot of current (recharging quickly) even when fed a relatively low
recharge voltage. Given the controversy about the maximum safe
recharge voltage, and given how quickly they recharge even at
relatively low voltages, I prefer to be conservative and keep the
voltage under 14 volts.

It sounds to me as if you've got a workable setup for this battery
right now. You'd be floating it at around 13.8, and recharging it at
(13.8 minus whatever voltage drop occurs).

Exide seems to rate their AGM batteries for a 25-ampere recharge rate.
My hunch (which you might want to verify with an ammeter) is that the
battery you have won't try to draw more than that from a 13.8-volt
supply, and that you'll be within a safe recharging regime.

You *might* want to consider trimming down the output voltage of your
supply to 13.6 or so, which would cause a trivial decrease in transmit
power but might give you some safety margin to keep the battery from
starting to electrolyze during float charging.

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

Icom 02AT with wall wart.
Icom BC-35 plus extra Ice brick battery $ 65

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have several Scsii hard drives, and a Scsii CD changer.
No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

Doug,

Of course, NOW somebody comes up with a link for you for a tone board made specifically for your rig. If you don't want to send back the Spec Com board, I think I know an easy way for you to find the modulation point...looking at the board that is a direct replacement for that rig, it appears the tone board plugs onto 7 or 8 pins that must be present in the radio. One of those MUST be the audio input to the modulator. Check the service manual to find the pinout for that connector and you should be home free...

Tired of trying to use your older software on those new Windows XP, USB

and fast computers?
This laptop is speedy enough to play on the net and run most
applications yet compatable with you older Motorola Software. Have
those "Error 2003" With you Maxtrac program? Solve it right here.

Available:

Toshiba 2505CDS Laptop

233 Mhz Intel Pentium Processor
32 Mb RAM
2.1Gb Hard Drive
2 PCMCIA Card Slots
Li-Ion Battery (working)
Built in 20X CD ROM
Built in 3.5 inch Floppy Drive
S Video Video out
Yamaha Stereo Sound
USB Port
9 Pin Com Port
15 Pin RGB Video port
Infrared Port
7 Lbs.
Windows 98 Operating System
12.1 Color Bright Display
Power Supply

This laptop is also loaded with the following software:

Windows 98 Operating System

Internet Explorer Ver 6.0

Microsoft Office (which includes):Microsoft Excel, Microsoft Access,
Microsoft Binder, Microsoft Powerpoint, Microsoft Word

Microsoft Works 2000

Microsoft Outlook Express

Quicken Home & Office 2005

AND MUCH MORE for you "Programmers"!!!
EMAIL ME for a more complete list!!!

I have a TWO of these units and each has a working battery (I've worked

on
it without the Power Supply but I haven't timed the length)

$179.00 SHIPPED in the US!

<snippety>

I would point out, from direct and bitter experience, that this
system is still way too fast for some of the older DOS RSS packages,
including:

Syntor X9000
MCX1000
(possibly) HT600
(possibly) MT1000

The authoritative references on computer compatibility with
Motorola's RSS packages can be found at:

http://www.batlabs.com/newbie.html

And...

http://www.batlabs.com/arc/rsshlp.txt

A listing of Motorola's current RSS versions, and their
compatibility with various OS versions, is at:

http://www.batlabs.com/arc/rss_020604.pdf

There is also a Motorola Technical Service Bulletin floating
around which describes, in gruesome detail, which packages are expected
to work on a fast computer and which are not.

This system sounds like a good deal, but I would urge any buyers
to research compatibility first.

> Windows 98 Operating System

One thing you should NEVER, under ANY conditions do, is try to run
DOS-based RSS in a "DOS Window" on a Windows-based machine. Motorola's
DOS-based RSS requires total control over the serial port's UART, and
this is something that Windows does not typically allow.

Keep the peace(es).

Well, trimming the original spam is good, too. Especially when
they are always drive-by, write-only postings.

Anyway, "Subject: forum" has now been added to the rec.radio.*
section of the killfile here.

1228. Re: Extreme Cycle Duty Orbital battery charging voltage??

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-09 19:05:51 UTC
From: JB <ac6tk@cybertime.net>
Message-ID: <d0ni6s$fv4$1@madmax.keyway.net>
Source record: 16601

Good question! I have an Astron RS35m modified to VS-35m and a couple of different group 27 batteries. One is a SLA and the other is an Interstate Deep Cycle flooded. I know you aren't supposed to parallel unlike batteries. I brought the other in out of the trailer to charge and it's been there ever since. I had it set to 13.8 for the radios, and after about a year, checked the Interstate and found it about a GALLON low in the cells. I filled it back up and it seems to work fine. That's when I modified the Supply to Variable (screw adjust with locking shafts) and dropped it down to 13.2v. The batteries never got warm to my knowledge though. Rather than a rectifier (I was afraid of an exposed diode) I added a 30 ATC fuse in line from the pass xstrs to output terminal and a heavier crowbar circuit. If the fuse blows, the output meter drops. A larger resistor was added to the wiper of the internal Voltage Reference adjust to limit current back from the battery. A Silicon rectifier has .6v drop.

Now to the Orbitals. You don't say what color. Yellow top are said to be deep cycle. Blue top are said to be dual purpose. You might want to check the specifications on their web page or whatever. I hear they are more rugged and can charge harder. I don't see any need to. It is hard for me to believe that electrolyte trapped in a glass mat with thin plates is "better". If you are just floating, I would think you could set to 13.8 v (with .6 drop in rectifier) and forget it. In a car they hang from a bunch of hi draw and start and charge at 13.8-14.4v. They say not to equalize more than 4 times a year!

Do a Google on them and there are mixed opinions of them. I've never bought one because they are twice as expensive as a flooded deep cycle.

1232. Icom 706MkIIG PL Tone Problem

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-10 02:59:54 UTC
From: Willco2 <willco788@ameritech.net>
Message-ID: <vI6dnc6A4sa2JbLfRVn-hA@comcast.com>
Source record: 16605

The PL tone in an Icom 706 MkII G is generated by
the CPU. An internal A to D generates a stair
step function creating a low frequency sine wave.
The PL tone is coupled to the transmit audio
circuits through a low pass filter.

I noticed that the step function also generates
other frequency components that pass through the
low pass filter and modulates the FM in the
in the audio range. The frequency components are
present when the PL is turned on and can be heard
using another VHF receiver. Using the oscilloscope
in my service monitor, I could even see the the
stair step transitions in the demodulated audio.

I talked to other hams and received e-mail
claiming that their 706 doesn't have that problem
but if you turn the mike gain all the way down,
with another VHF receiver listen to 706 on a simplex
frequency with the PL on, you will hear the tones.
When the PL is off the tones disappear

In the 1980's I worked for Rockwell Collins as
a Engineering assistant. I worked in a group
that analyzed design flaws in products and I am
confident that my diagnosis is correct.

I run a radio repair shop in my home and a
customer complained that the PL in his 706MkIIG
was off frequency and he couldn't access a local
repeater. After checking his radio I noticed
that it was producing low level audible tones
around 1000Hz. I check my 706 and two others
that were in my shop. They all did the same
thing. Several friends have Icom 706's and
repeating an on the air test I could hear
the tones even through an open repeater.

The step function is so poorly filtered that I
couldn't measure the PL frequency with my HP 5334
frequency counter. I had to used an audio bandpass
filter between the test point on the radio and the
frequency counter.

The beat tone changes when a different PL is selected.
I think it's possible that the right PL and beat tone

can cause problems with PL decoders on some repeaters?

Did I open a can of worms?

However... If you have played the programmin game as long as I have,
you'll also find some computer have a distaste for motorola software
more that others. Although for Maxtrac, MT1000, HT600 as you quoted,
you MAY have to go into the BIOS, It WILL run those with no probem and
still can use used for other uses.

hello, i'm relatively new to ham radio and had a few technical
questions i was hoping to throw out...anyone that can answer these
would be very helpful!

1. i've seen transmitter schematics that were simple, and others that
were complex. as a general rule of thumb, are the more complex ones
trying to compensate for frequency drift, or maybe eliminate higher
harmonics? how efficient and/or stable are the simple transmitter
schematics?

2. other than frequency range, what characteristics are you concerned
about when trying to match a transmitter to an amp?

3. without an amp, couldn't you still run the signal to an antenna and
it would be a weak transmitter? all the amp does is increase the
voltage and current supplied to the antenna, correct?

4. for an FM transmitter, does the modulation occur to oscillator
directly, or is the oscillator's signal modulated after "leaving" the
oscillator? i guess what i'm asking is whether or not there is an input
to the oscillator, or is it just an "output only" frequency generator?

thanks!
jason

> schematics?

One obvious thing is that CW transmitters tend to be simple, SSB transmitters complex. But there are a thousand design variables. One big one is the complexity of the ICs employed. Today you can have a very stable VFO with just a few parts. You tend to pay a little bit of a price in phase noise, but frequency drift is not an issue. With an analog VFO, you can add a lot of complexity trying to get around frequency drift, but phase noise is never an issue. Years ago, all you had was analog. A few years ago, DDS (direct digital synthesis) was complex and expensive. Today, analog VFOs tend on the expensive side! It is similar with amplifiers. In many radios, all, or most, of the PA is in a single brick, instead of a fistfull of parts. Ditto with almost everything up and down the chain.

Frequency is also an issue and again that is changing with technology. A few years ago, it was hard to get directly to VHF. You typically had several oscillators getting mixed up, frequency multiplied, etc. This was especially true if you had an analog VFO because it is very hard to get stability at VHF, and multiplying the frequency also multiplies the drift in an analog VFO. There are still reasons you might want to do some mixing up to get to VHF with a DDS VFO, but DDS parts up into the gigahertz range are now cheap parts.

It was only a few years ago that a DDS VFO cost hundreds of dollars. Today you can buy a chip with a VHF synthesizer and amplifier and modulator for less than the tuning capacitor in an analog VFO.

> 2. other than frequency range, what characteristics are you concerned
> about when trying to match a transmitter to an amp?

If you are buying commercial, you are looking at price, of course, and expected reliability, along with power consumption. For SSB, you need the amplifier to be linear, which implies lower efficiency. For FM/CW you don't need linear, so the amp can be a lot more efficient. If you are designing the amp, then you are worrying about impedance mathcing, as well.

> 3. without an amp, couldn't you still run the signal to an antenna and
> it would be a weak transmitter? all the amp does is increase the
> voltage and current supplied to the antenna, correct?

Yes of course. There are times when you want a lot of power, but most of the time it really isn't necessary. Also, it is a lot easier to get antenna gain than power to the antenna, especially at higher frequencies. The need for power depends a lot on what you do, what frequencies you operate, and to a degree, what "floats your boat". If you are doing EME or HSMS, you need a fair bit of power - hundreds of watts, anyway. If you are chatting on the local repeater, typically a watt is as good as a kilowatt. Lots of folks called QRPers like to use very low power. For them the "legal limit" is five watts, but many try to see what they can do with milliwatts. The current miles/watt record is held by a guy who operated 40 microwatts over a 500+ mile path.

> 4. for an FM transmitter, does the modulation occur to oscillator
> directly, or is the oscillator's signal modulated after "leaving" the
> oscillator? i guess what i'm asking is whether or not there is an input
> to the oscillator, or is it just an "output only" frequency generator?

Typically you would modulate the oscillator, although these days, the audio may well be simply data to the synthesizer. However, because FM is typically done at VHF and higher, there may well be additional oscillators mixed with the modulated signal to get up into the VHF/UHF range.

Hope this helps

..

Good info to know. I was kinda looking around to make a (mostly) IC transmitter like that... (anything 70cm and under). Are you aware of any chip PN's or schematics I could dive into to learn?

Thanks,
Dave

Analog Devices' parts are favored by hams. The greatest number of projects out there use the AD9850, but that part is a little older, and does not provide modulation input. Also, it is really only good up to about 30 MHz, you can push a bit past that but the power requirements explode and the noise goes up. Without any component changes it will go down to 1 Hz. Newer AD98xx parts are starting to get more attention, and some of those are useful up into the low 100's of MHz. The 99xx parts have more features yet.

TI has a TRF4400 which is a 440 MHz synthesizer with modulation and an amp (not much of an amp, tho!), and the almost identical 4900 for 900 MHz. Some folks have used these down to 6 meters. The TI parts have greater channel spacing than the AD parts, but that also reduces the frequency of the crystal or oscillator, which has a big effect on the power consumption. TI also has a 2050/1/2 which are synthesizers (I don't recall if they have modulation) up into the gigahertz range. I've been toying with using one of the TI parts as a VFO for an HF rig by using a prescaler to divide down the frequency (and consequsntly the spacing).

The AD parts are pricey, but AD is very good about samples. The TI parts are all in the five buck neighborhood. There are a zillion projects/kits out there based on the AD parts.

If you've ever built an analog VFO, these DDS parts are like black magic. They take little in the way of support circuitry, no fretting about layout, no spending weeks trying to work out the temperature compensation, no moving around because you breathed on it, you just dial in the frequency you want and you are spot on.

..

1246. easy money in 30 days

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-11 03:04:36 UTC
From: trip <jotto105@wi.rr.com>
Message-ID: <1110510276.745573.49370@z14g2000cwz.googlegroups.com>
Source record: 16619

MAKING MONEY I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups and came across an

article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6

names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at

least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: "what have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00. WellGUESS WHAT!!... Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over

$10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more than that on the!! Let me tell you how this works and most importantly,

why it works.... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Suggestion: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the money come in!

It's easy. It's legal. And, your investment is only $6.00 (Plus postage) IMPORTANT: This is not a scam; it is not indecent; it is not illegal; and it is virtually no risk - it really works!!!! If all of the following instructions are adhered to, you will receive extraordinary dividends. PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the

money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list. Here are the 4 easy steps to success: STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the

U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to the following addresses: #1)Dan Warner 2812
W. 1st. St. Duluth, MN 55806 #2) Karen Green 50 Gillinder Street Rockhampton Qld Australia 4700 #3) Ryan Lake 41130 Congerbay Dr Harrison Twp, MI 48045 #4) Zac Inchley unit 82/ 128 Benowa rd Southport

Qld Australia 4215 #5) Carl Baker 2267 N. Kedzie 1st floor Chicago, Illinois 60647 #6) Jason Otto 600 s. 1st st. Waterford, WI 53185
STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc.) and add

YOUR Name as number 6 on the list. STEP 3: Change anything you need to,

but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more

you post, the more money you make! This is perfectly legal! If you have

any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal laws. Keep

a copy of these steps for yourself and, whenever you need money, you can use it again, and again. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the

notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded

and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches

the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business! ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS---------- Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning

of this letter and drag your cursor to the bottom of this document, and

select 'copy' from the edit menu. This will copy the entire letter into

the computer's memory. Step 2) Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list. Step 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you'll always have this file to go back to. Step 4) Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.) Step 5) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in

the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done with your first one!
Congratulations...THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to

the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT. ** Now the WHY part: Out of 200 postings, say I receive only 5 replies (a verylow example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of

the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2

and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What

are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups

everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual

internet. Remember, play FAIRLY and HONESTLY PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at

it this way. If you are of integrity, the program will continue and the

money that so many others have received will come your way

1247. samlex voltage-sag is causing an undervoltage-reset issue

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-11 03:21:49 UTC
From: tom <cyberhun@shaw.ca>
Message-ID: <h98Yd.638935$6l.436634@pd7tw2no>
Source record: 16620

I have an HT that draws 1.9 amps when transmitting, and the voltage can't sag more than 2v or the HT does an undervoltage reset. I just bought a samlex 12v, 4amp power supply to run my HT but there's a problem. The samlex 12v output voltage begins to sag as soon as the mic is keyed and the amount of sag increases steadily until 3-4 seconds into the transmission the HT does an undervolt-caused reset because it's input voltage has sagged 2v. I might not be able to return the samlex to the shop and replace it, and I'm wondering if there's something that can be done to enable me to use it some way, somehow to power my HT. The HT will work fine on a reduced transmission power setting but then I can't reach repeaters. I have another wall -wart plug in adaptor that puts out 1700mA at 12v.
-Is there some way I can combine the two power supplies together?
-In parallel maybe? Parallel would probably work if they were batteries because I know in series the voltage would exceed the max of 16v.
-How about some kind of arrangement with a transformer?
-If I get a lead-acid, 12v, 10amp/hour battery, how complicated acircuit would I need to charge the battery from the samlex? is this a possibility?

> amplifier to be linear, which implies lower efficiency. For FM/CW
you don't
> need linear, so the amp can be a lot more efficient. If you are
designing
> the amp, then you are worrying about impedance mathcing, as well.

i guess what i meant was more along these lines: you need to make sure
the peak-to-peak input voltage and current capabilities of the input is
matched with the amp, right? or does the amp have a lot of leeway in
those regards?

> > 4. for an FM transmitter, does the modulation occur to oscillator
> > directly, or is the oscillator's signal modulated after "leaving"
the
> > oscillator? i guess what i'm asking is whether or not there is an
input

> typically done at VHF and higher, there may well be additional
oscillators
> mixed with the modulated signal to get up into the VHF/UHF range.

just to make sure i have it straight, if i were to transmit a sine wave
at 146mhz, anyone listening in on 146 mhz wouldn't hear anything
(except maybe less noise than usual). if i were to vary the frequency
between 146.0001 and 145.9999 at a rate of 100hz, then anyone recieving
would hear a quiet 100hz tone. now if i were to vary the frequency

between 146.001 and 145.999 (holding all previous listeners constant), then anyone listening would hear a much louder tone...correct? or am i not understanding it yet? ;-)

thanks again for the help!

Actually, no. Typically the amp doesn't have a lot of flexibility there,
but in general the exciter does.

In amateur practice, the impedance of almost anything that connects together
at RF is 50 ohms or converted to 50 ohms. Given that, the power level then
converts directly to voltage and current.

Typically, HF exciters have a lot of range in output power. The FCC
prohibits the sale of HF power amplifiers having a required drive of less
than 80 watts. Since most HF exciters have 100 watts out, the required
input power of HF amps is rarely specified, since it will almost always
match almost all exciters. I don't think other countries have the same
rules, but the FCC also requires that the amps cannot easily be modified to
accept lower drive, so it is expensive for manufacturers to make amps
differently for different markets, since that typically would require a
complete redesign.

On VHF, it's a little different. Most VHF exciters only have a few output
power settings. VHF amps generally specify the input power, and typically,
it will be a fairly wide range. But still, if you want, say, 200 watts at 2
meters, you would buy a different amp for a 5 watt HT than you would for a
50 watt mobile.

> between 146.001 and 145.999 (holding all previous listeners constant),
> then anyone listening would hear a much louder tone...correct? or am i
> not understanding it yet? ;-)

That is exactly right.

There is a weird behavior of FM receivers called the "capture effect". A
signal of sufficient amplitude at the input of an FM receiver cose to where
the receiver is tuned will totally quiet the receiver. In an AM, CW or SSB
signal, the amplitude is converted to audio almost directly. As a result,

noise on the input appears as noise on the output.

FM is different, though. In FM, we want to hear the frequency modulation. When there is no signal, we hear the detector randomly wandering around trying to interpret the noise as signal, but the amplitude of the noise really has no effect. Once a signal is detected that is strong enough for the detector to follow, the detector follows the signal and there is no more noise. To exaggerate this effect, most FM receivers amplify the signal so much that the amplifiers become saturated and amplitude variation in the input signal is clipped (well, softly clipped), so that the later stages of the receiver see the same amplitude. This is different than AM/SSB/CW where it is the amplitude changes you are looking for.

This is one of the reasons that FM signals have so much higher quality ... any noise is actually a result of noise in the receiver (or transmitter) rather than the atmosphere. With other modes, not only can you hear the atmospheric noise, but at lower frequencies, the atmospheric noise is many times higher than the noise inherent in the receiver.

The other reason is bandwidth. In amateur practice, FM signals are 5 kHz wide, compared to about 2.5 for SSB. In commercial practice, FM signals are wider still.

There is another "gotcha" in your description above. If you vary the carrier at, say, 1000 Hz, from say, 146.999 to 147.001, the actual bandwidth will be somewhat wider than you expect, and it will be dependent on the frequency of the modulation. I know this doesn't make sense, it has to do with some weird math. If you studied Fourier series back in school it was some abstract mathematical thing that had nothing to do with the real world. Well, guess what. Fourier has everything to do with radio! The result is that to stay within the 5 kHz bandwidth, the highest modulating frequency has to be somewhat lower than 5 kHz. This is one reason why the FCC prohibits amateurs from broadcasting music; reasonable fidelity of music requires higher bandwidth than voice.

..

1252. Re: Motorola Programming Laptop

Perhaps you didn't get it but what the newbie really wants is to hang a KW amp on to his kit FM broadcast wireless mic. Maybe my assumption is wrong.

For FM, audio is applied directly to the oscillator, not after. Cheap transmitters are usually low power and drifty. They can sound great though. Expensive transmitters can be low power and stabile and can sound great. Stabile and RF clean are the first design features, next comes power. The major problem with hanging an amp on anything, is that is tends to amplify not only the RF signal, but any other spurious or broadband noise from the transmitter. This is the bad part, so what you have to do then is design the transmitter for low noise and bandpass filter it before going to the amp then Low pass filter (well).

Some of more complex transmitters are to allow it to be rock steady and channelized.
Simple transmitters must be crystal controlled with temperature compensation (where most of the cost will be) but may be actually cleaner and more noise free than a synthesized transmitter. A simple tunable transmitter will usually walk up and down faster than you can tune the radio.

If you really are talking about ham radio, Ramsey makes some cool inexpensive kits that really work great for a base station. If you have a decent location or antenna, low power is fine. Most will want more channels and other features, but might not make it sound any better.

Note: FM Ham and Land-Mobile radio uses a much lower level of modulation and different equalization than broadcast FM radio, so the oscillator and audio designs are very different in that respect.

1256. IC-730 and IC-735 battery question

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-12 05:53:23 UTC
From: Robb Leamy <rleamy@alltel.net>
Message-ID: <a3aef$423283d7$a6667960$19071@ALLTEL.NET>
Source record: 16629

Hi,
Can anyone shed some light on the internal battery of the IC-730 and IC-735
function of these two rigs?
I've seen some sources say that the battery maintains Icom programmed data
and if battery fails it will be necessary to return the rig to Icom for
reprogramming. Others say, only user programmed memory data would be lost
if the battery dies? I suspect that the 730 may need to go back to Icom
while the 735 might retain Icom's programming.
Any ideas?
thanks, Robb WB8BHU

I have a 735. The internal lithium battery does nothing but maintain
the info for the 10 or 12 memory channels. If the battery goes out,
the memories go, but the radio otherwise still functions normally.
Icom rates the battery for about 5 years' use, but my 1983 rig still
has the original battery and it's going strong.

Other Icoms, and the 730 might be one of them, lose all factory
programming when the battery goes.

Look at the specs of your VHF FM Ham rig. It says bandwidth is
16K0F3. That's 16 kHz for 5 kHz of Dev. at 1 kHz modulation
frequency.

So to stay within 5 kHz bandwidth you need to reduce the audio
bandwidth and dev A LOT less than 5 kHz dev.

Consider 900 MHz and other 12.5 kHz channel radios that are 10K0F3
and sound like dirt.

> There is another "gotcha" in your description above. If you vary

HELP!!! Help!!!!

Ok here I go... I just received my Rascal GLX interface in the mail
today, hooked it up and it worked fine on receive. BUT and i do mean
BUT! when i tried to transmit a picture, all i received for a report
was it was sending a harmonic tone.???????
Now here are the particulars of my set up:

My Rig is a Kenwood TS-690S
My Computer is a 733Mhz with stock soundcard.
My OPSYS is Windows XP Home Edition.

I have hooked up the Black interface cable as stated
Green Plug to output of interface
Black Plug to input

White cable, Mic to mic on radio
Black Mini to speaker on Radio which makes no difference other than I
can not hear the radio when receiving a Picture, so I Disconnected
that to be able to hear when a picture was being sent.

I am using MMSSTV newest version. My transmit is set up to com-port 1
and my radio is set up for KENWOOD.

Now, here is the question>>.............

WHY CANT I SEND A PICTURE??? HELP!!!! Anyone!!!!!
Thanks and 73's

Does anyone here remember the simple CW transmitter that used a 6146 as a keyed ocillator? It would put out about 60 watts. There was a very low current light bulb in series with the crystal to limit the current that could flow in the crystal circuit. I think it was in the 1959 or 60 HANDBOOK. I used a gaseous regulator tube on the screen. It didn't chirp too badly.....Analog VFO's yes now there is a fun project!

Anybody have any experience with Maptech's offshore navigator? I picked up a copy and have had nothing but problems with it. Seems to be very buggy at best.

1278. FA: Astatic JT-40 JT40 Microphone For Ham Radio Or Harmonica - LAST DAY!

Uniden Bearcat BC780XLT base mobile trunk tracking scanner complete with box, manual, mounting bracket and AC power supply.
$225.00 plus shipping.

Uniden President HR2510 10 meter all mode mobile radio. This is also complete. $ 155.00 plus shipping.

Both radio's are currently installed in my truck, but are in very nice condition.
These are for shipping in Cont. US only, USPS money orders only.

thnx

1284. FS complete satellite antenna system

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-13 16:06:17 UTC
From: Jerry Reed <jreed123@cox.net>
Message-ID: <0yZYd.20055$KK5.7806@fed1read03>
Source record: 16557
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment

I have a complete Satellite antenna system for sale in the Phoenix AZ area. It consists of the KLM 2m 16 element and 440 40 element yagis with the KLM circular switches. A fiber glass boom. A Yaesu G5400 az-el rotor. Henry preamps for both 2m and 440. A filter to keep the 2m signal out of the 440. A TAPR Trackbox and a control box for the circular switches and the preamps. Everything works and is in like new to used condition. I also have coax and cable for the rotors and switches etc. I am asking $1000 for the whole thing or any pieces. I also have 3 Rohn 25 tower sections that I would sell reasonably if the antenna buyer wanted them. I am in Phoenix AZ and would of course prefer a local deal, but I am willing to drive a reasonable distance to meet someone or it can be all broken down and shipped. If it doesn't sell it will all be on E-Bay. Please reply E-mail for any questions or a phone number.
73 Jerry W5RCQ

Well, you caught a typo, I guess that does make you smarter then the
rest. I guess this gives you the right to belittle the handicapped also?
I see that you have upset somebody so bad that they posted your address
and phone number, and your best comeback was to threaten then with
"It's pretty hard to outrun a shotgun or an SKS, or even a 45 pistol as
well.
By the way, my neighbours are all heavily armed as well. "

You carry all those weapons with you all the time?
By the way you spelled neighbors wrong! Correct your own spelling before
you make fun of somebody else's.
I'm done listening to you turd, you are such a bore! You did show your
ignorance by answering to DXass.

thanks again for the help...your answers led me to a couple other
questions, if i may ask?

xpyttl wrote:

> In amateur practice, the impedance of almost anything that connects
together
> at RF is 50 ohms or converted to 50 ohms. Given that, the power
level then
> converts directly to voltage and current.

so if i were to design a transmitter around an COTS amp, how would i
determine what i needed to "drive" it at, in terms of voltage? if i
have 3 variables (V, I, and R) then i'd need to know 2 of the 3, then i
can solve for the third... as it is, i only know R...?

> This is one of the reasons that FM signals have so much higher
quality ...
> any noise is actually a result of noise in the receiver (or
transmitter)
> rather than the atmosphere. With other modes, not only can you hear
the
> atmospheric noise, but at lower frequencies, the atmospheric noise is
many
> times higher than the noise inherent in the receiver.

so i imagine people can do CW over FM, but does it usually occur on (I
guess what would be called) a simplified AM transceiver? either a
signal's present or not?

also, when people refer to ASK and FSK, is ASK basically an audio
output that's been sent over FM? and FSK is more like CW, only to a
receiver that can monitor both mark and space (0 and 1) frequencies?

thanks again!
jason

I believe he meant AFSK (audio frequency shift keying) vs FSK (frequency
shift keying).

yes, that is what i meant. i didn't even know amplitude shift keying
existed.

am i correct about afsk being audio tones transmitted over FM, while
fsk is just alternating between two non-modulating frequencies?

This group has the most complete collection of modifications, usage tips, links to related websites, documentation, and photos along with a user survey and a message forum (3250 messages archived) to help you get the most fun and DX out of your Realistic / Radio Shack DX-394, DX394, DX 394.

Over 90 mods and tips now listed plus a dozen on the To Do or Wish List. More mods than for any other general coverage receiver! Thoroughly documented with a Master Index. If you like to tinker with radios, I know of no other recent model that lends itself to as much fun in this arena as the DX-394. Great platform for learning radio-electronics. Always 1 or more FA on eBay.

Active & friendly user community now with over 800 members. Some members are keen short wave listeners; others are into AM DXing and a few enjoy long wave. Many experiment with antennas and some are ardent modifiers - customising and souping up the rig as hot rodders would do with cars. You'll find lots to interest you and help get the most out of your radio.

Mods & Tips since 17 Oct 04:
- RF: FRONT END PROTECTION FROM HAM TRANSMITTER

- RF: OVERLOAD MITIGATION - WIDEBAND PRESELECTOR

- ANT: WHIP - REPLACEMENT

- RF: OVERLOAD MITIGATION WITH OUTBOARD ATTENUATOR

- AGC: HOTTER S-METER AND AGC ACTION

- DEMOD: SYNCHRONOUS AM DETECTOR

- OSC: UPGRADE STABILITY OF 2nd LOCAL OSCILLATOR

- RF: SHIELDING WITH ALUMINUM DUCT TAPE or STEEL TAPE

- CONTROL: CUSTOM MAIN TUNING KNOB

- AUDIO: ENHANCED ANTI-CHUFF MOD AKA MODE CHANGE CLICK BLANKER

1297. ICOM IC-260A CTCSS - using Pin 5 of accessory connector?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-14 02:48:19 UTC
From: wb0gaz <wb0gaz@hotmail.com>
Message-ID: <1110768499.212676.106890@g14g2000cwa.googlegroups.com>
Source record: 16569

I need to add CTCSS to transmit of ICOM IC-260A. I have a manual (file) but no schematic. The manual says that the accessory connector pin 5 is "output of transmit mic amplifier" or words to that effect. Can I put CTCSS tone signal into that pin on transmit? Other suggestion? Anyone care to look at their schematic of this rig to tell me where this pin of the accessory connector goes?

Very tks,

73 Dave WB0GAZ wb0gaz@hotmail.com

That's pretty close, but not exactly on target.

AFSK can be used on top of either AM or FM. In amateur systems it's
most commonly used with FM.

FSK shifts the carrier frequency... a process which counts as a
modulation. The amount of frequency shift (in Hz) and the rate at
which you shift it (also in Hz) vary a lot from one usage to another.
There are both narrow-band and wide-band FSK modulations in use.

thanks! also, i was just reading about mixers... and getting confused.
i've run some matlab programs to figure out how you can take something
at frequency x and frequency y, and end up with an output of frequency
(x-y). one transmitter's mixer i saw took a 160mhz and 14mhz input to
get a 146mhz output. adding or multiplying them together certainly does
not yeild 146mhz. so how does that work?

thanks for the help!
jason

>
> jason
>

You are partly correct. If audio tones are fed into the microphone input (audio stages) of an AM or FM transmitter you are generating AFSK. If an audio tone is fed into a SSB transmitter it will generate a single output frequency. If the tone is switched off and on , it will be received as a CW transmitter being keyed off and on. Some newer transceivers generate CW this way. If the tone is shifted in frequency , the output will be a carrier shifted the same ammount. This is received the same as a FSK transmitter. You can get the same effect if you have a crystal controled transmiter and switch a capacitor across the crystal to change the frequency.
There is almost no way to tell the differance between the two. If 100% pure tones are used and everything else it 100% correct then there is no differance in the transmitted signals. As always nothing is 100% and you can tell the differance with very close and strong signals. This is still close enough it does not matter.

You need a nonlinear function in order to get mixing behavior, and
create the sum and difference frequencies.

If you just add (e.g.) sin 160x and sin 14x, you end up with a simple
sum of sins, and no other frequencies show up - ordinary superposition.

Run the resulting sum through a nonlinear function (e.g. square it, or
take the square root, or clip it whenever its absolute value exceeds
1.0, or something like that), and take a look at the frequency content
of what you get as a result.

>I believe he meant AFSK (audio frequency shift keying) vs FSK (frequency
>shift keying).

The ITU emission designators for some digital modes and some typical
usage:

* A1A On/Off keying for manual reception (Morse)

* A1D ASK, Amplitude shift keying. The only recent use I have seen
is in some 433 MHz SRD (Short Range Devices)

* F1D Pure FSK (RTTY is classified as F1B)

* F2D Audio subcarrier modulated by amplitude or frequency (e.g.
1200 bit/s AX.25 packet) modulating an FM transmitter

* A2A Audio subcarrier on/off modulated by Morse code modulating
an AM transmitter (e.g. aeronautical beacons in the LF band)

* A2D Audio subcarrier modulated by amplitude or frequency
modulating an AM transmitter

* J2A Audio subcarrier on/off modulated by Morse code modulating
an SSB transmitter (many amateur multimode rigs)

* J2D Audio subcarrier modulated by amplitude or frequency (e.g.
300 bit/s AX.25 packet) modulating an SSB transmitter

On the air A1A and J2A are equivalent.

On the air F1D and J2A are equivalent and can be generated and
detected in both ways.

I hope this clarifies some of the issues.

Hi
I have posted the schematic for this radio in the manuals section at.
www.mbars.co.uk

1306. Re: ICOM IC-260A CTCSS - using Pin 5 of accessory connector?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-14 10:12:04 UTC
From: Roger Adam <roger.adam@remove_this.virgin.net>
Message-ID: <UrdZd.513$JN1.474@newsfe4-gui.ntli.net>
Source record: 16579

Dave,
the internal mic circuit has audio HF & LF filtering. This means that if you were to apply a signal below 300Hz or above 3,400Hz into the mic circuitry,then the level of this signal will be greatly reduced, or even removed.

The CTCSS signals centre around 100Hz and therefore cannot be injected into the mic socket.
In fact you have to travel all the way through the mic circuit until you get to the microphone op-amp (IC1) See circuit as per Paul.

The amp IC, IC1 has a resistor/cap feedback circuit which provides the req'd filtering. The CTCSS encoded signal output should be injected around Pin 1 (output of IC). There maybe voltages at this point ,so a capacitor must be used to block this voltage. You will see two varicap diodes D1/D2 and it is the varying AF voltage feeding these diodes that produces the modulation of the carrier.

I have carried out this mod on my IC-290E, by using an external CTCSS encoder chip (FX315) mounted in a small aluminium box with DIP switches for selection.

I connected a small piece of screened wire from Pin1of IC1 and connected it to a spare pin on the nine way facility socket on the rear panel. At this point I also connected the aforementioned cap.

A transmit switched voltage for feeding the external CTCSS unit supply line was found on this facility socket. Please check the circuit for your radio.

Remember that the CTCSS encoded signal should only be activated when you transmit.

Dave, you must have a good look at the schematic provided by Paul and come up with a plan of attack.

You will of course understand that you attempt these modifications at your own risk. It worked for me on my IC290.

Do a search for FX315 encoder/decoder chip circuitry on the net. I got my chip(not cheap) from Mode Components.(UK)

Regards and good luck and thankyou Paul for schematic.

Hello,

I'm looking for docs about the KV-90 transceiver.
I've got one with a broken antenna, and I cannot find any schematics
about this material.

Does anyone know where I can find such docs ?

thanks in advance

1309. Re: ICOM IC-260A CTCSS - using Pin 5 of accessory connector?

Paul and Roger - thank you very much for the very helpful information.
I've retrieved the schematic and had already obtained the user's manual
from the ICOM website. I'll study the schematic.

As for the tone generator, I'm planning on using an old laptop computer
and "nch tonegen", which is a software program that can generate an
arbitrary sinewave signal. The main task at hand is to isolate and
bring the appropriate connection point out to the back panel where I
can supply the tone on transmit.

Again, thank you both for your fine support!

Got a close look at the schematic, and indeed the external "mic amp output" connector pin 5 of accessory jack is basically the same as the audio output of the microphone itself, useful for DTMF insertion but not useful for CTCSS. It appears likely I can attach near/to the output of the deviation control R115 which feeds through a series resistor and capacitor to the FM modulation varactor D32. This looks like it's near the center of the lower PC board in an area that's not too cluttered. I'm not sure if I'll need to inhibit the tone on receive or not; the circuit appears dedicated to transmit mode only.

Again, thank you very much for the insight - it would not have been possible to start this project without your kind help!

Dave,

you're more than welcome. It's all about keeping the hobby alive I suppose.

I wish you well with your laptop generated CTCSS tones. It certainly is an interesting and novel approach!. Post again when you have some more info.

Be careful about "loading up" the varicap circuit and thereby reducing the deviation, when you connect your soundcard? You'll need to check that the deviation levels of voice signals mixed with CTCSS do not become excessive.

regards,

Roger, G7JAQ. Surrey, England

That is not correct either. AFSK is used extensively with Amateur Radio
digital systems, such as PSK-31, RTTY, even CW can be and is generated
using AFSK. And the modulation METHOD is not important. It can be either
Amplitude or Frequency Modulation.

Dan/W4NTI

Tired of trying to use your older software on those new Windows XP, USB and fast computers?

This laptop is speedy enough to play on the net and run most applications yet compatable with you older Motorola Software. Have those "Error 2003" With you Maxtrac program? Solve it right here.

Available:

Toshiba Tecra 8000 Laptop
This unit comes with Windows 98 (for your Motorola Programming) AND Windows XP operating system.

366 Mhz Intel Pentium Processor
64 Mb RAM
7.8 Gb Hard Drive
2 PCMCIA Card Slots
Li-Ion Battery
Built in 24X CD ROM
Stereo Sound
USB Port
9 Pin Com Port
15 Pin RGB Video port
Infrared Port
6.5 Lbs.
Windows 98 AND Windows XP Operating System
14.1 Color Bright Display
Power Supply

This laptop is also loaded with the following software:

Windows 98 Operating System w/

1315. SERIOUS MONEY OPPORTUNITY-$5 INVESTMENT-HIGH RESPONSE RATE-QUICK RETURNS

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-14 21:32:50 UTC
From: feedbackzz@yahoo.com
Message-ID: <1110835970.095026.163420@z14g2000cwz.googlegroups.com>
Source record: 16588

Follow the directions below and you could
have $5000 in your PayPal account in 2 weeks.
There is a very high response rate in this
program because of its low investment, high
yields, and quick return. If you are a skeptic
and doubt that the program will work, I urge
you to give it a try anyway! It REALLY WORKS-
that is why so many thousands are involved in
programs like it. Don't miss this chance.

If you achieve only moderate success, your
PayPal account will still have several hundred
dollars in it within the next couple weeks.
If you actively promote the program, you could
soon have $8,000 in your PayPal account.

SIMPLE: All you need is $5 and a free PayPal
account. Pay $5 to one person.

SECURE: PayPal (BBB member) handles all
transactions. No one sees your bank or credit
card information.

LEGAL: See Title 18, Section 1302 and 1341,
US Postal and Lottery Laws.
The details of this business make it legitimate.
You are using the Internet to advertise your
business opportunity. You have a mail order
business that collects email addresses from
people interested in home-based online business.
You provide a service-mailing list membership-
in return for a small fee. Treat your mailing
list as a business. Keep accurate records,
declare your income, and pay income tax on it.

INSTRUCTIONS

STEP 1: COPY and PASTE this letter onto a
blank notepad file. SAVE as a TEXT FILE.
Keep it for the next time you need the
program.

STEP 2: Get a free PayPal account
(5 minutes setup time) at www.paypal.com.
Register for a PREMIER account (not a

PERSONAL) so that others can send money
to your account.

STEP 3: Using your PayPal account, send $5
(US DOLLARS) to the email address (PayPal
account) in position #1 of the list below.
PayPal will ask for a payment type-select
SERVICE. In the SUBJECT area, enter
"Please add me to your mailing list"
(this is very important). If you prefer
that your email address not be given to
other mailing list businesses, enter
"Please add me ONLY to your mailing list"
in the SUBJECT area. In order to send
money, you can deposit $5 into your PayPal
account with your own credit card, use
your bank account, or register for the
PayPal credit card.

IMPORTANT: IN ORDER FOR YOUR BUSINESS
TO WORK, YOU MUST BE HONEST AND SEND $5.
The mailing list business remains successful
due to the honesty and integrity of those
involved. $5 is a very small investment,
especially when you are about to receive
many times that much! If we are all honest,
we will all make money.

STEP 4: After you send your $5, remove the
address from position #1 of the list below.
Put the address in position #2 into position
#1. Put your own email address (PayPal
account) in position #2. Some engines will
automatically hide part of an email address
when the letter is posted in a newsgroup.
It may look like this:
yournam...@wherever.com

To avoid this complication, enter your
email address using 2 separate lines,
like this:

2) yourname (press ENTER on your keypad)
@wherever.com

(If you ever encounter the dots, click on
SHOW OPTIONS at the top of the letter, then
click on REPLY. Scroll down through the
original letter to find the full addresses.)

Both people on your list have already bought
mailing list memberships for $5! The program

is working! Note: If you put your name in position #1, you will not receive money from the hundreds that other members find.

CURRENT PAYPAL ACCOUNTS:

1) cwhatton22
@charter.net

2) feedbackzz
@yahoo.com

STEP 5: COPY and PASTE this letter (with your address in position #2) in emails to at least 60 newsgroups, chat sites, discussions, message boards, etc. It takes less than a minute to post the letter. The more you post, the more money you can make. People will see the letter heading as they scroll through the list of postings in a particular group. PASTE the heading below into the subject area of your email (you can also write your own heading):

SERIOUS MONEY OPPORTUNITY-
$5 INVESTMENT-HIGH RESPONSE RATE-
QUICK RETURNS

Use the search engines (Internet Explorer, yahoo.com, google.com, altavista.com, excite.com) to find sites. Search for moneymaking forums, moneymaking message board, money chat, employment message board, business message board, business discussions, etc. You can create your own free webpage (try webspawner.com, cmlb.net), then post links to your site. Try posting a notice on community and college bulletin boards to direct people to your webpage.

THIS BUSINESS WORKS

When your name reaches position #1 (usually in less than a week) it will be your turn to receive $5 deposits. If you personally find 20 interested people, and they each find 20, you make $2000. If you find 40 people, and they each find 20, you make $4000. Remember that the response rate is very high. Since there are only 2 names on the list, you can expect 80% of your profits within 2 weeks.

Participants who actively promote their mailing
list average between $5,000 and $8,000 and
receive the funds within 3 weeks.

Relieve your financial stress NOW!
Become a part of the mail order business and
help people to help people.
This program is about helping each other!

1316. 4 sale

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

Icom 02AT with wall wart.
Icom BC-35 plus extra Ice brick battery SOLD

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have several Scsii hard drives, and a Scsii CD changer.
No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

That is a fair question, and one which is frequently asked.

Look up the trig identity for (sin a)(sin b). Let a and b each be in the form wt [w stands for greek lower case omega], so a = 2(pi)f1(t) and b = 2(pi)f2(t) where f1 and f2 are your two frequencies in Hz. Do the substitution & algebra on the identity, and then I think you'll see where the signals at the sum and difference of frequencies f1 and f2 come from. :-)

The name "mixer" can be a little misleading.....it doesn't necessarily just sum the two inputs in a linear fashion (by just adding them, like a kitchen mixer combines the ingredients for a cake) but there is also an element of non-linearity in the electrical network.

Depending on the nature of the non-linearity, mixing can also generate other higher-order products, like signals at 2f1+f2, 2f1-f2, etc. Whether this is good or bad depends on your particular application. For example, do some reading on "intermod".

I have a Standard C528A twin-band (2m/440) HT that's 12 years old. I've not used it for a few years, and when I pulled it out of mothballs last week, I powered it up using an external supply and it simply acted bonkers. It would not respond properly to all keypad commands.

Taking the HT apart, I found a dead 3-volt lithium battery. I replaced it with a fresh one, hit the little reset button inside the push-to-talk switch, but to my chagrin found absolutely no change. The radio still acts like it's stuck in a particular mode and I cannot punch in a frequency with the keyboard.

Am I not resetting this radio properly? Is there a particular sequence of keys I need to hit?

Thanks!!!!

Try turning the radio off.
Hold down the "F" key, the "Mon" key and turn on the power. You may
hear a series of beeps then release the keys.

I have a C510 and this is how the reset sequence goes for it and they
may be using the same CPU or programming for it.

The IC-730 does not have an internal battery at all. The memories were backed up with an external power source.

The battery on the IC-735 ONLY backs up the memory channels. When its bad or changed all the memory channels will return to 28.000 MHz.

Turn off the radio, hold the reset button in WHILE turning on the radio.
Also, isn't the reset button on the opposite side of the radio from the
ptt switch?, and the function switch is alongside the ptt???? It should
be the same setup as the C228A (2M/220)..... Also, you might need to
have the memory cart reinitialized. I hope not though.

Good luck!

I presume "F" is the function key.
I cannot find a "Mon" key on this rig. Is it labeled something else?

I've held in the reset button while powering up, and no change.

Yes, you're right -- the reset button is on the other side of the HT from
the push-to-talk switch. I got them mixed up!

1327. Re: ICOM IC-260A CTCSS - using Pin 5 of accessory connector?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-15 02:30:18 UTC
From: wb0gaz <wb0gaz@hotmail.com>
Message-ID: <1110853818.351175.198880@g14g2000cwa.googlegroups.com>
Source record: 16500

Hello Paul and Roger,

I wanted to tell you that tonight (about 2000 MST) my ancient ICOM IC-260A is successfully accessing CTCSS-controlled repeaters! This is due entirely to your help. I found easy access to the junction of R114 and C103, at the "upper" end of R114 (it is a 15K resistor on-end.) I scraped away some of the insulation, and soldered in series a 10K and 0.1 uF capacitor, then from there a shunt 2.2K to ground, and out with a piece of RG-174 coax. The coax is fed through one of the unoccupied pins on the ACC connector, which I drilled out to about 3mm with a drill bit (a tie-wrap is a strain relief to prevent pulling the coax out from the radio.) The end of the coax is a 1/8" mono phone plug, which goes into the audio output of my quite-ancient IBM Thinkpad 365, running NCH Tone Generator tonegen.exe version 2.01. The output level of tonegen is maximum (0dB) and the tone imposed on the output audio is not very loud, but it is adequate to reach two different repeaters I tested, and I imagine it will vary depending on the laptop and the resistor values I used.

Anyway, this is really satisfying - with your help an old derelict radio is now back in service in my shack, with my laptop doing duty as the CTCSS generator. It wasn't necessary to create any T/R switching or other controls on the tone - it just runs continuously from the laptop.

Again, very much thank you (and the manuals section you host proved quite invaluable this time, and I'll look forward to improving my library.)

Just as an aside, this project is actually a prototype for a ham friend who was disabled a couple of years ago - I want him to get access to IRLP, and I found a 2M transceiver (Kenwood TM201B) for USD 35, which needs only CTCSS to bring it to life in a similar mode (he already has the necessary laptop.) So your help has actually done double duty.

Thanks again,

73 Dave WB0GAZ wb0gaz@hotmail.com

1329. Questions for FT857 owners

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-15 03:09:12 UTC
From: "Joe S." <nobody@nowhere.net>
Message-ID: <d15jkq01t7s@news3.newsguy.com>
Source record: 16503

I installed an FT-857D and ASAT-120 on my old Nissan pickup -- took a couple of days what with running power cable, modifying an antenna mount, grounding everything, etc., etc. First contact from the Mississippi Gulf Coast was a YU1 on 20 meters at 1500 CST.

Now -- here's my question: Do I have to TUNE and INIT the antenna each time I change bands?

As you know, to TUNE the antenna you use the FUNC and SELECT to go to menu k, hit the A button -- TUNE -- then, hold in the A button for one second -- which causes the antenna to tune. Do I have to do this each time I change HF bands, or, does the rig do this automatically after I TUNE and INIT the first time?

Thanks.

Would have worked as well - the wiper of the pot goes through the 15K resistor and capacitor into the varicap. I'll keep that in mind should I find a rig with no schematic in the future.

Joe:

Every time you change bands, you need to Tune the antenna. The radio will NOT automatically tune to the new band when you change. Trying to transmit into the antenna while on the wrong band will only cause you grief. When I had the atas-120 on my 857, I left the menu at the correct place that I could just press the tune button (A). You should be aware that according to Yaesu, you should only Tune when stopped, not while driving down the road (of course, nobody I've ever talked to bothered with this restriction, and I didn't even know about it for the first six months I owned the antenna).

The combination can be fun for awhile, but depending on how you have the atas-120 antenna mounted on your truck, you may find it isn't exactly the best antenna for mobile use... First, if you have it mounted high enough to get out decently, (like at the level of the cab roof) you will likely be replacing whips as they break off. Second, unless the mount is extremely stiff and free from vibration, the internals of the antenna will desolder themselves occasionally... Fortunately, both are easily fixed (a larger diameter whip helps considerably in keeping the breakage down, and the two main solder joint failure points are easy to re-solder when they go bad.) Still, I replaced the whip three times before I drilled out the whip socket and used a larger diameter whip. (If you use a slightly longer one, it also tunes easier on 40 meters). I only used it for HF from 40 to 10 meters, as I have a separate antenna for 2meter use. The atas-120 really is a pig on 2 meters, even fully collapsed.

I finally just got tired of it failing at odd times, and switched to a set of Hamsticks. Cheaper, more reliable, only takes a few seconds to swap out (though I do have to stop to change bands), and they seem to get out a bit better.

Good Luck

Hi All,

I am just learning to use my new TS-480S/AT (100 watt) transceiver.
Question, with my previous HF radios, TS-440 & TS-450 I was able to adjust the freq while in memory mode.
However I can not seem to find any information on how to do the same thing on the TS-480S/AT.
Can someone please advise me if this can be done, and how to do it.

Regards

Kevin, Zl1KFM.

"Mon" key would be the one you push to "monitor". It either opens up
the squelch if you are on simplex, or checks the input frequency if you
are on a repeater split. On the C510 is right below the PTT button.

Build one. A Cinch-Jones S-304-CCT connector should work. (Mouser P/N 538-23041) These are rated at 10A but should be fine in this application.

1344. Ten Tec 238 Tuner indicator problems - restring?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-15 22:23:39 UTC
From: Joshua G Senecal <senecal@ucdavis.edu>
Message-ID: <Pine.LNX.4.61.0503151417060.11788@pc33.cs.ucdavis.edu>
Source record: 16517

Hi All,

We have a Ten Tec 238 Tuner, and we're having some problems with the display/indicator for the roller inductor. To be specific, the indicator is out of adjustment. When I crank the inductor CW the indicator moves to the right, but after going about 1/3 of the way it reverses direction and moves back to the left! When I crank the inductor CCW the indicator moves to the left and stops when it reaches the edge, but there's still more turns left on the inductor.

I'm guessing that we're going to have to open it up and either replace/readjust something. I know nothing about this tuner, and have no idea as to what I'm going to require, nor how to go about it.

I did some searching (Google etc.) but was unable to find anything helpful.

Any hints/advice?

Thanks!

-Josh Senecal, AE6IQ

1345. Re: Questions for FT857 owners

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-15 22:42:16 UTC
From: "Joe S." <nobody@nowhere.net>
Message-ID: <d17oc8026sb@news1.newsguy.com>
Source record: 16518

Rick:

Thanks for the advice. That's what I figured out -- I leave the menu set on TUNE DOWN UP and when I change bands I hit the TUNE button and wait a few seconds while it tunes -- which it does quickly.

I have a small pickup with an aluminum cap on the back with a ladder rack on the cap. I mounted the antenna on the ladder rack so it is essentially mounted in the center -- more or less -- of the truck. I made some jumper cables using #10 stranded wire and ring terminals to bond everything -- I connected these jumpers:
-- Bolted one to the side of the FT857 where the mount bolt goes and bolted the other end to the floor of the truck -- loosened the bolt holding the seat to the floorboard and put the ring terminal on that bolt. The FT857 is on the floor under the seat.
-- Connected one jumper from the antenna mount to the ladder rack, bolted through at each end.
-- Connected one jumper from the frame of the cap to the bed of the truck.

I have been using the rig for just over 24 hours and have made a number of contacts from the Mississippi Gulf Coast to all sections of the US, Europe, and South America.

I cannot find an address or phone number for Standard Amateur Radio Products. The manual for my HT (from 1993) gives a post office box in Niles, Illinois. I looked through a 2001 issue of _QST_ but Standard did not advertise in it. Is the company even still around? A web site address given for them is worthless.

Thanks in advance!

Sorry to report that my radio must be completely different from yours; it
has no such animal on it. There is a rotary control to break the squelch,
and a function key on the keypad lets you check an input frequency...

Ooops, let me continue....

I have several Standard radios and I have found that if you understand
the programming on one, others are easy to pick up.

You may want to try contacting Matt Adrian at sarts@qtm.net. He was
doing Standard radio servicing at one time. He may know the hard reset
sequence on that radio.

John,
This has been covered on the TenTec mail list. at contesting.com. I am not
certain whether they maintain an acrchive or not. This is one of the reasons
that Ten Tec has changed their design to
do away with the string dial in the B model.

You might also write to Service at tentec.com and I'll bet they would send
you instructions on what to do.

1364. impromptu dipole

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-16 12:51:17 UTC
From: tom <cyberhun@shaw.ca>
Message-ID: <9ZVZd.691450$Xk.476937@pd7tw3no>
Source record: 16537

If you really needed to get a 2m rig on the air and you didn't have an swr meter, do you think you could get way with creating a simple dipole if it was VERY carefully cut according to the formula, and if you wound your own impromptu balun out of 5-6, 4" diameter turns of the (RG-8)cable right below the dipole? Even if the resonant frequency wasn't exactly in the middle of the 2m band, how much damage to the rig would you be risking? I don't see how it could do any serious damage, even if the swr was somehow slightly in excess of 2, or is it just something that is never, ever done --- not checking the swr first with a meter? According to the antenna books I'm reading, 1/2 wave dipoles (where each radiating element is 1/4 wave) don't need fancy matching transformation stuff, the only issue might be RF coming back through the outer braid and causing the cable to radiate --- thus the 5-turns-on-the-cable balun.

It's a cheap slide rule dial. These things have been around forever. Not
much more than a string and a spring. Take the cover off and at least try
to fix it. Mine just slipped off the drive shaft and took less time to
repair than you took typing your question. If you get stuck, call or email
the factory. It's a horrible design and they all slip eventually. The
service manager can talk you through the repair in his sleep.

First, remember that most local 2-meter activity is going to be
vertically polarized. That means the dipole would have to be held by
one end with the other end down. A very simple antenna for 2-meters
is the J-Pole. There are numerous sites giving the dimensions for one
made out of common TV twin-lead. You can also make one out of 1/2"
copper pipe soldered together. These are very simple antennas that
are inexpensive to build and will outperform the dipole you are
considering.

Message-ID: <42384198$1_2@newsfeed.slurp.net>
Source record: 16542

I found nothing wrong with the fit and finish of my 1026. Just be aware that the 1026 is not easy to adjust and can easily appear not to be working if the sense antenna is not adequate and if the operator doesn't grasp the correct adjustment procedure. Make sure the interfering signal can be heard well on the sense antenna.

1370. Anyone pull COS off an ADI?

Hi All,

I am going to be using an ADI 247 as a temporary link radio and am wondering if anyone has used one of these in the past.

If you have, can you give me any tips on where the best point to pull COS from may be? hi or lo... either will suffice.

Thanks!

Jim...

Thanks, that's usefull info --- but what about the swr issue? If a half wave dipole is tuned to a certain frequency and has an swr of 1.05, say, for the swr to rise to 2 (at VHF wavelengths) you have to go roughly 6mhz up or 5mhz down from that tuned frequency. The 2m band is only 4mhz wide in total, anyway, so if you measure carefully, are you risking damage to the rig (also assuming the rig has no swr protective circuitry) if you don't check the swr with a swr meter? I don't have one, that's why I'm asking.

AFAIK all commercial rigs made in the last 15-20 years have protection.

I wouldn't worry about an SWR of 2.0. You could always buy an SWR
meter. They aren't very expensive. Without one you are just going to
be flying blind. Many things can affect SWR besides the antenna
length. Are you sure your radio doesn't have SWR protection? Most
do. What is the make and model?

Dick

What you're proposing should work fine. For each quarter wave element,
length in feet = 234/frequency
or
length in meters = 71.4/frequency

So each quarter wave element would be around 18 or 19 inches,
depending on where you want to be in the 144-148 mhz range. The
formula should get you close enough to keep from blowing up your rig.

Coiling the coax as you propose shouldn't hurt anything, either. Try
to bring the coax away from the antenna at a 90-degree angle, and
hanging the antenna vertically would help if you're trying to work
mobiles or repeaters.

Also, you might consider a ground plane vertical, attaching five
quarter wave wires to a female coax plug, one vertical wire, with four
radials in the holes on the ground side.

My other cohort suggested a ground-plane vertical, too. What's the deal with ground plane verticals? It seems they are slightly mechanicaly more complicated than a half wave dipole, but that's fine if there's some advantage. Are they safer to use without an swr meter?

I haven't bought it yet --- it'll be a IC-2200H. They (swr meters) might not cost much, but it's more than I'll have. I just went through a $300 nightmare with a used Yaesu VX5 that supposedly worked perfectly untill 4 days afetr I got it when the Tx final just overheated and crapped out. So the all the money I spent on 7-10amp ps is basically wasted too. So, please don't recommend buying anything used because I just want to get on-air, and I only have another $400 or so and I want to make sure I can do it with that. If I have to wait anothe rmonth to get stuff like an swr meter, fine.

Make just about any kind of vertical with a vertical section of about 19.5 inches and use either 3 or 4 radials about 20 inches long drooping to around 45 degrees. You can also take two wires about 19 inches long and make a vertical dipole. Feed the antenna with some rg-58 about 50 feet or more long. The coax will have enough loss in it the swr as seen at the transmitter will be low enough as not to worry. While I don't recommend this as anythihng like an optimal antenna, it will get you on the air. That is what I put up here when I moved in about a year ago and have not gotten around to doing anything beter as I don't work 2 meter FM that much.

Yeah, that's what I figure, too. I should have mentioned that even though the rig is a mobile unit, I'm using it as a base station from my basement suite, so the antenna doesn't need to be capable of being mounted on a vehicle. Given that new piece of info, doesn't it make more sense for me to make a simple, 2-wire dipole temporary antenna than a ground plane? Or are there some reasons why ground plane antennas are better than dipoles?

One of the main reasons is mounting. The dipole will have to be
strung from the ceiling or something high. The ground plane can be
set on a table, file cabinet, etc. It can also be mounted on a pole
and just set in a corner of the room.

1381. " BIG BUCKS" WITH ONLY $6.00 INVESTMENT "NO BULL"!!!!

Newsgroup: rec.radio.amateur.equipment

From: bscruggins2000@yahoo.com
Message-ID: <1110999356.007574.110090@f14g2000cwb.googlegroups.com>
Source record: 16454

HOW TO TURN $6 INTO $6,000!!!!!! READING THIS COULD CHANGE YOUR LIFE!

I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, Yeah right, this must be a scam,but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: what have I got to lose except 6 stamps and $6.00, right? Then I invested the measly $6.00. Well GUESS WHAT!!... within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over $10,000.00 and it`s still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it`s still coming in rapidly. It`s certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how this works and most importantly, why it works....Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy!
Suggestion: Read this entire message carefully! (Print it out or download it.) Follow the simple directions and watch the money come in! It`s easy. It`s legal. And, your investment is only $6.00 (Plus postage)

IMPORTANT: This is not a scam; it is not indecent; it is not illegal; and it is virtually no risk - it really works!!!! If all of the following instructions are followed exactly, you will receive extraordinary dividends.

PLEASE NOTE: Please follow these directions PERCISELY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it`s a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the

mailing lists is secondary to the income which is made from people like you and me asking to be included in that list. Here are the 4 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper; PLEASE PUT ME ON YOUR MAILING LIST. Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to the following addresses:

Mailing Addresses

1. P. FREY, 4577 W. PONDS CIR, LITTLETON, CO 80123
2. E. DE LEON, 14014 Rosecrest, Houston,TX 77045
3. A. Lopez, 810 Ave.J, South Houston TX 77587
4. L. Pacheco, 812 Ave.J, South Houston, TX 77587
5. K. Bat, 9335 Alcona Street, Lanham, MD 20706
6. B. Scruggins, P.O. Box 845 Port Barre, LA 70577

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money you make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws.
Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again.

PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way.

NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.)
So, as each post is downloaded and the directions carefully followed,

six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you`re in business!
---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS---------- Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select `copy` from the edit menu. This will copy the entire letter into the computer`s memory.

Step 2) Open a blank `notepad` file and place your cursor at the top of the blank page. From the `edit` menu select `paste`. This will paste a copy of the letter into notepad so that you can add your name to the list.
Step 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you`ll always have this file to go back to.

Step 4) Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.) Just example you log on any search engine like, yahoo.com,google.com, altavista.com,excite.com then you search with this subject millionaire message board? or money making message
board? or employment message board? or money making discussions? or money making forum? or business message board? etc. You will find thousand & thousand message board. Click one by one then you will find the option post a new message.
Step 5) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You`re done with your first one! Congratulations...THAT`S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200
That`s it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.
JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now

those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "What if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet.

Remember: Play FAIRLY and HONESTLY and this will really work.

The Icom IC-2200H most definitely has SWR protection. That radio is
only $230 from places like HRO. If you have $400 to spend, you should
have plenty to get on the air.

Getting best performance (pattern) out of a 2-wire dipole usually
requires that you bring the feedline out in a perpendicular fashion
for some distance before you turn it in a downwards direction. This
may or may not be convenient.

You'll also need ways of tensioning or supporting the wires to keep
the dipole fairly straight and vertical, and this also may be somewhat
inconvenient. You'll either need to hang the upper wire from a
support above it, and hang a weight of some sort down below the bottom
wire to keep the antenna taut and keep it from swinging in the wind,
or use fiberglass rods or something like that to support the wires.
In either case, you'll have to have a non-metallic support structure,
and keep the antenna a reasonable distance away from any metal-bearing
portions of the structure (pipes, stucco walls containing chicken
wire, etc.).

A quarter-wave ground plane can be made quite simply from three to
five pieces of copper wire and an SO-239 connector. The
feedline comes down the bottom, and if the feedline is sufficiently
stiff you can probably support the whole antenna just by using plastic
tie-wraps to lash the feedline to a vent pipe on your roof and letting
the feedline bear the (very modest) weight of the antenna. You won't
need an overhead support, you won't need any sort of balun (loop or
otherwise).

The gain pattern of a center-fed half-wave vertical dipole, and a
quarter-wave monopole with two to four radials drooped downwards at 45
degrees, are very very similar. See

http://www.cebik.com/gp/58-2.html

and take a look at the second chart of the radiation patterns - it
compares a vertical dipole with two ground-plane antennas (horizontal
and drooped radials). "In practical terms, the low-angle lobes of
the dipole and the 45° sloping-radial monopole overlap, with the
90°-radial monopole slightly weaker."

So, basically, I think you'll get equivalent performance from a
monopole with a ground plane, and will find the mechanical

arrangements rather easier to manage.

How about the stripped back coax-coax? That's where you peel the outer conductur back, exposing 19" of the inner conductor, and the 19" piece of peeled back outer sleeve is the opposing radiator, and the feedline just continues in a straight line out of the peeled back part. Then you tie or tape the top to a hook and simply hang it. This avoids the entire issue of making the feedline approach the feedpoint at a 90 degree angle. What's your take on this design? I like its simplicity.

>your take on this design? I like its simplicity.

A simple "sleeve" dipole. They can certainly work. I suspect that
tuning them can be a bit tricky - the velocity-of-propagation on the
upper, exposed-center-conductor portion is likely to be a bit
different than the velocity down the folded-back braid section.
They're probably a bit prone to RF on the feedline due to coupling
between the end of the folded-back braid, and the braid inside it.

Weather is another issue - rainwater will get into the braid quite easily
and will run back down the coax into your station. [Trust me on
this... I once failed to adequately RTV-waterproof the RG-8X coax at
the feedpoint of a copper-pipe J-pole, my SWR went sky-high after the
first big rain, and I found water and moss (!) inside my N connector.]

Commercial sleeve dipoles are often built of a copper pipe of two or
more diameters, and sometimes have an additional decoupling sleeve
down below the lower radiator section.

A stripped-back-coax sleeve dipole could make a very handy emergency
field antenna, but I don't think I'd depend on it for base-station use.

How about if I put the stripped-back coax antenna inside a waterproof plastic bag that went over the top of it? I think that would certainly help keep it dry, but would the plastic bag create any kind of mutual-inductance problems, or does that only happen with conductors or materials with hi dialectric coefficients?
I remember reading that a the larger the diameter of the radiating element, the slower the propogation velocity, so I agree with you about how it might screw up the normal calculations --- but by how much, though? Given that a vhf dipole has an 11mhz wide band within which the swr is below 2, does it matter if the resonant frequency is off even if its off by a mhz or two?
If I wound the feedline itself into an 8 turn, impromptu balun and slid a ferrite bead on the feedline just below the end of the dipole part as a further barrier to return RF, wouldn't that basically eliminate any significant return current issues?
Am I missing anything, or can I basically count on a setup like this one to not stress my final? If not, why not?

I think it all depends upon how strong the interfering signal is. If the internal whip antenna can hear the signal, then the 1026 will do the job. If not, then you'll need an external noise antenna. You can easily connect the external antenna to the 1026 and unscrew the telescoping sense antenna if you're not going to use it.

If you really want an effective and simple to build 2M antenna for FM work, purchase an SO-239, (UHF Female chassis fitting) and a couple pieces of brass welding rod, or hobby rod.

Using nothing more than pliers and a solder iron you can make a nice ground plane antenna. Vertical piece cut to about 19 inches, three or four radials cut to about 20 inches, and bend the ground radials down about 45 dgreees. This will provide a near perfect 50 ohm match. Simply screw the PL-259 on your cable on to this antenna and tape it to the side of a wood or metal pole. Real easy, and real effective.

. A couple other guys who know what they're talking about are also recommending that same arrangement. 50 ohms on the cable and 50 ohms on the antenna --- perfect. No need for a matching device, I like it. But aren't dipole-like configurations supposed to present 73 ohms of load? Why is a 1/4 wave groundplane only 50 ohms?

The bag would have to be 24" long. You need to keep not only the very top of the stripped section dry, but the whole area where the braid comes out of the stripped insulation and is then turned around downwards.

> I think that would certainly help
>keep it dry, but would the plastic bag create any kind of mutual-inductance
>problems, or does that only happen with conductors or materials with hi
>dialectric coefficients?

A thin plastic bag would have little effect on the antenna's characteristics - the layer of plastic dielectric is too thin to change the behavior significantly.

The bag would probably make the antenna rather more prone to flap around in the breeze, and that'd probably cause much more of an effect than the bag itself would.

>I remember reading that a the larger the diameter of the radiating element,
>the slower the propogation velocity, so I agree with you about how it might

At a wild guess, a few percent.

> Given that a
>vhf dipole has an 11mhz wide band within which the swr is below 2, does it
>matter if the resonant frequency is off even if its off by a mhz or two?

Can you cite the source of that figure? Seems a trifle wider than I'm used to seeing.

>If I wound the feedline itself into an 8 turn, impromptu balun and slid a
>ferrite bead on the feedline just below the end of the dipole part as a
>further barrier to return RF, wouldn't that basically eliminate any
>significant return current issues?

Possibly so. Quite honestly, a small amount of RF on the feedline is not likely to cause you any problems. It'll alter the antenna's pattern somewhat but since you're dealing with a wide-pattern omni I doubt that you'll notice any significant change in the real-world performance.

>Am I missing anything, or can I basically count on a setup like this one to
>not stress my final? If not, why not?

Maybe yes, maybe no.

Issue 1 is how well the antenna actually tunes up on your frequencies
of choice, which will depend on a lot of factors which are difficult
to predict in advance. For example, whether the folded-back braid is
stretched downwards along the coax insulation, and how tightly, will
probably alter the effective length of the sleeve by as much as an
inch or so and could significantly shift the SWR. Nearby objects, the
length of the feedline (if there's RF on the outside of the coax),
etc. can also affect the tuning. It's a lot easier to try, measure,
cut, and try again than it is to predict the behavior with the desired
degree of precision.

Issue 2 is how well your radio deals with higher-SWR conditions. Some
rigs seem to have active load-mismatch-detection circuitry and an
active power-reduction capability. Others seem to depend on having
rugged, conservatively-rated RF power transistors, operated well below
their safety margins, which are capable of standing a lot of abuse.
Others just emit blue smoke and give up :-(

Hence, it's likely to depend on your rig and your antenna.

Frankly, if you're concerned about the risk of damage, I would
encourage you to [1] build a design such as a ground plane which uses
relatively rigid parts which won't move around during use and thus
won't be likely to de-tune, and [2] find somebody who has a VHF-rated
antenna analyser, and borrow it for the half-hour needed to trim your
antenna to a low SWR. I'd think that any ham club with a couple of
dozen active members, is likely to contain at least one member who
owns an MFJ 259 or similar and is willing to Elmer you on a simple
antenna construction-and-tuneup project.

>dipole-like configurations supposed to present 73 ohms of load? Why is a
>1/4 wave groundplane only 50 ohms?

The simplest ground-plane-style antenna has its radials sticking out
sideways. It's a monopole. The actual radiator is only half as long
as a dipole, and thus has only half as much radiation resistance, and
the feedpoint impedance is only half as much as that of a dipole.
It's on the order of 35 ohms or so.

If you bend the radials until they point straight down, you've got a
center-fed dipole with the feedline running up the center. Feedpoint
impedance is somewhere around 70 ohms.

Feedpoint resistance of anywhere from 35 to 70 ohms are available via
the obvious compromise - just bend the radials down less (for lower
resistances) or more (for higher resistances).

In most installations, radials bent downwards at an angle of about 45
degrees result in a 50-ohm resonant feedpoint resistance.

Seeing that you are getting the rig in the future, you might want to
take your antenna to the shop when you pick up your rig. They will
probably be glad to see that it is tuned for your radio so you don't
ruin it.

I am going to use the same car antenna for AM/FM and 2M. This means I need a diplexer that transitions somewhere between 108 and 144 MHz. I haven't seen something like this offered commercially. Has anyone seen a product like this, or failing that, a design I could duplicate? The antenna will be a 1/4 wave on 2M, and would also be used as a (not quite ideal) AM/FM antenna.

Hello, tom. I may be coming in to the discussion a little late.

My IC-V8000 and IC-2720 both have SWR protection circuitry that folds back the power output if the SWR is too high. The '8000 folds back to 25 Watts and the '2720 goes to 15 on both bands.

If you want the operator's manual for your pending IC-2200 you can download it from either www.icomamerica.com or www.icom.co.jp (and probably Icom Canada's web site too, though my first stab at the name didn't find the site -- icomcanada.com maybe?) and read all about its features before you get the radio in your hands. I wouldn't be at all surprised to find it'll fold back to a usable power level if the antenna is less than perfect.

What is with you and the swr meter? Forget it. Make a dipole and hang it up.Make a groundplane and hang it up. Get a cheap 1/4wave commercial mobile whip, cut it 19" long, stick it on a metal bracket and screw it to the house gutering. Bandwidth is so wide at VHF you won't have a problem. I've never bothered with an swr meter at VHF. The formulas work.

Antenna Specialist makes/made them. I may have a few laying around.
A/S also made one for VHF low, which I do use for my 6m mobile.

1418. Reducing transmit power on Yaesu FTdx560

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-17 15:29:34 UTC
From: wb0gaz <wb0gaz@hotmail.com>
Message-ID: <1111073374.557728.85470@g14g2000cwa.googlegroups.com>
Source record: 16491

I'm looking at the schematic for the Yaesu FTdx560 and see that the HV winding is tapped in several places (0/340/460/600) --- I have in mind to pick a different tap for transmit HV to reduce max power output. The rig puts out >300W on lower bands - this is far too much for my QTH considering proximity of neighbors - I'd actually like to have it run at something in the 25-50 watt range (I like the rig otherwise, just don't want to run that power output level here.) Any thoughts on consequences of selecting a different tap for the plate voltage? Other changes should I consider (screen voltage and/or grid bias to restore the tube's operating point, drive level, etc.?) It seems given this choice of taps I could even connect between the 600 and 340 point for 260VAC, or 600 and 460 for 140VAC if 340VAC proves excessive.

73 Dave WB0GAZ wb0gaz@hotmail.com

1419. Low Power AM Radio Broadcasting

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-17 16:21:46 UTC
From: WCRV@webtv.net
Message-ID: <10699-4239AE9A-498@storefull-3317.bay.webtv.net>
Source record: 16492

The Low-Power AM station hobby has become more popular over the past 2 years.
In the U.S, it is legal to broadcast over the AM band 540kHz-1700kHz using a 3
meter antenna and a 100mW transmitter.
Until recently, building a small AM radio station was very complicated and very expensive, until now.
Using a SSTRAN AMT-3000 transmitter, which comes as a kit for under $100.00US, or a built version which comes assembled and tested for under $200.00 US, and a 3 meter, coil loaded and tunable antenna for around $225.00 US, anyone can get on the air right now!
I get questions about range: the system I am describing has had reports from 1/2 mile to over 4 miles! Range totally depends on these factors: location, scope of the land, conductivity, choice of frequency/adjacencies, and use of this antenna.
If the transmitter and antenna are installed correctly in a proper area, several miles are possible. Many people are interested in a good, solid local signal and this system does it for a fraction of the amount of money you will spend for a comparable system.
If you are interested in low power AM Broadcasting, I invite you to visit this site:
http://antenna18431.tripod.com/antenna.htm
In this site you will find information on the 3 meter antenna, pictures of it, information and pictures of the transmitter and a link to email questions, comments and inquiries to.
If you would like to be on the air, this is an excellent choice to do it well, and at a very affordable price!

Source record: 16399

I went ahead and tried it, "smoke test" style, and the change worked quite well. I moved the HV winding transformer tap from "0V" to "240V" (there was a misprint on the schematic, but looking at the transformer itself it was easy to see what to do) --- the (receive-mode) plate voltage went from 880V to 500V. I then cut a wire to the second PA tube filament, disabling it. The bias control was slightly different setting, and I didn't change screen voltage or try to re-neutralize. A quick tune-up test shows the rig now produces about 100W max on 80, 40 and 20 (my unit isn't functional on 15-10M due to alignment or other issues). This is close enough to what I expected.

I believe the original poster wanted to know how to create a dipole. If you want to make a dipole
with a vertical configuration, you have to use a method which keeps the radiators vertical and the
feedline horizontal for some part of a wavelength. Try this:

Make a TEE shaped assembly of PVC pipe using a TEE connector, one piece of PVC about one metre long
and two pieces of PVC about 25 centimeters long. The longer pipe mounts horizontally and the
shorter pipes are oriented vertically. Cement all the pieces into the TEE. Strip the outer jacket
off a length of RG58 about 20 inches from the end. Make an opening in the braid next to the outer
jacket and pull the center conductor through so that the braid and center conductor are sepatate.
Push the RG58 into the long pipe and make the center conductor bend up into the upper vertical PVC
and pull the braid down through the lower vertical PVC. If necessary, prune the center conductor
and braid for best SWR, but the SWR should probably be low enough as is.

I get it, and then maybe once it's all set, I could put end-caps on the top and the bottom of the vertical segment to keep it dry. Maybe it would be good to put in some kind of fastener, too, holding the flexible braid immobile against the interior of the downward-pointing vertical segment --- before the installation of the end-caps, obviously.
I like it --- simple but effective.
But does the horizontal segment have to be an entire meter, though? I think I can remeber seeing those T-like, FM antennas mounted on large towers but with horizontal segments that were shorter than a meter --- I think they were slightly shorter than the vertical segments.

1430. Help ID'ing QRM

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-18 05:04:09 UTC
From: Ken Bessler <kg0wx@NOSPAMyahoo.com>
Message-ID: <djt_d.14823$Fy.7702@okepread04>
Source record: 16403
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

The following website has a <1M .mp3 file of some QRM
I'm getting on 160 meters. A little background is in order:

My station has my PC about 3' away from my FT-857D's.
I've eliminated all cables except video so I'm pretty sure it's
not coming from them. I've powered off my monitor and
adjusted the refresh rate to no avail. I grounded the PC's
metal case and tried it with/without the side covers. No
difference in the signal.

Tonight I looked at my CPU temp and it was a tad higher
(127 deg F) than normal so I decided to turn on a box
fan pointed at the left side of the tower case. To my shock,
the QRM faded away! I switched the fan on and off several
times to prove my theroy. Then I made the mp3 recording you
can download here:

http://members.cox.net/kg0wx/index.html

Listen closely to the sound - at 2.2 seconds into the rec-
ording, you can hear the "tick" that is me turning on the
fan to "low". Within a few seconds, the QRM is gone!

Anybody know where I should look to find this and kill
it?

I would think that the likely suspect would be one that does
not already have a fan. I followed the signal as it went off
freq and faded. It climbed 3 kc on 40m then faded out.

Standard GX-3000 VHF APRS Radios. [with DTMF]
I have a quantity of Commercial Standard GX-3000 VHF Mobile Radios (136-150Mhz) 25-30 Watts O/P These radios will work excellent as an APRS Mobile OR Base Radio Station. Units are much cheaper to use for dedicated APRS use rather than spending Large Dollars for a VHF Amateur XCVR and dedicate it to APRS use. Programmed & Tested Operational on 144.390 Mhz. You will have to make up the Interface Cable. These radios are capable of 64 Channels, Carrier Squelch Only and I can program them for other 2 Meter Frequencies for a charge. Please ask should you have any questions.
Cost: $ 45 USD Plus Shipping

Hi Ken,

I don't quite follow the implication of your statement. Do you have a
dual CPU system, where one CPU has a fan and the other not?

As it appears to be temperature based (the reason why the fan appears
to be significant) and CPU based (over clocked for its operating
temperature); I would suggest trying to cool the CPU with an aerosol
(freeze mist) or one of those cans of air for keyboard cleaning.

You can use the "canned air" as a freeze mist ("spray cold"), or vice-versa, by inverting the can while you spray. They contain essentially the same stuff, the difference being that the "spray cold" contains a syphon tube to suck liquid up while the "canned air" doesn't.

Most modern PCs use a multi-stage power regulation system. The main power supply isolates and steps down the mains power to create several DC voltages (+5 and +12 in particular) which are routed to the motherboard. Then, an on-board regulator further reduces the voltage being fed to the CPU to meet the CPU's requirements.

Modern CPUs such as the Intel P4 family and the AMD Athlon consume a large amount of current (tens of amperes) at low voltage (1.2 - 1.8 volts, roughly speaking). Modern AGP graphics cards also operate on low voltages (AGP 4x is 1.5 volts, AGP 8x is 0.8 volts if I remember correctly) at high amperages.

To create such high currents at such low voltages in an efficient manner, single- or multi-phase "bucking" voltage regulators are used. These are switching regulators, which step down the main voltage (most commonly from the +12 supply) and step up the amperage. They typically operate at switching frequencies ranging from the high tens of kHz up to the low MHz range.

I suspect that the QRM you are hearing is from the fundamental or harmonic of one of these switching-regulator oscillator rates. Heating and cooling of the CPU and motherboard are probably causing the switching oscillator to drift a bit.

As to how to get rid of it... you're already on the right track, I think... shielding and filtering. Make sure that your monitor and

power (and other) cables have ferrites on them, as close as possible to the PC case. Make sure you've got a "tight" PC chassis, with metal shielding in every possible location (including screw-secured plates over any unused PCI slots, snap-in metal shields for any unused hard-drive bays, etc.). I recommend a chassis which is actually all metal, rather than one of the new lighter-weight plastic chassis with an anti-EMI coating on the inside. Don't run your PC with the side panels off - put 'em on and fasten the screws.

As for the gamer-style transparent acrylic PC chassis, forget 'em - I have serious doubts as to whether a PC build in one of these can pass the FCC Part 15 tests, let alone be RF-clean enough to use in a ham shack.

1443. Icom IC-28H Backlight Replacement

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-18 19:47:47 UTC
From: Dick <LeadWinger>
Message-ID: <kmbm319gl201ee3qjm5b30pv6vmd8mo3ih@4ax.com>
Source record: 16416

My Icom IC-28H has gone dark. Looks like both lamps are gone. The schematic lists these lamps as HRS-7219A-G40. I found a couple of places that had minimum orders of $100 and $300 respectively. That's out. I read a message on eham.net where a ham had replaced these lamps with amber LED's and appropriate resistors. Anyone done this? Other options?

Dick - W6CCD

Yes, I omitted those refinements as sort of obvious.

> But does the horizontal segment have to be an entire meter, though? I think
> I can remeber seeing those T-like, FM antennas mounted on large towers but

> were slightly shorter than the vertical segments.

I chose the one meter length arbitrarily so that it would be about a half wave. The idea is that
the feedline should be kept at right angles to the radiator for some distance. A coil of coax where
the feedling exits the PVC might be a good idea to reduce coupling.

If the idea of the coiled-feedline balun is to prevent the outer braid from turning into a radiating element, wouldn't it be preferable to position the coils in the feedline next to the antenna feedpoint instead of at the opposite end of the horizontal segment? Or would there be harmfull, inductive coupling to the the coils if they were that close to the feedpoint?
Also, if one were to use a ferrite-bead type balun (not the type that the feedline is wrapped around) instead of a coiled-feedline type balun, do you think it would it be necessary to have electrical contact between the ferrite-bead and the outer braid (necessitating stripping the outer insulation)?

I've already buttoned up the all metal case with grounded side covers.
I even made sure (with a DVM) they were grounded. (The ends of the
mini tower are metal with the front having a plastic facia on top of the
metal case front).

No help. The only thing that helped was taking both covers off and
blowing air through the chassis. I monitor 3 temps - CPU, Motherboard
and power supply exhaust air. Before the box fan, I was running CPU
at 129-140, Motherboard at 100-118 and power supply exhaust at
room temp +16 degrees (F).

Now I've got CPU at 113, MB at 93 and exhaust at room + 8 deg.

I was planning on buying a can of air and further investigating this but
I feel I've solved it with the box fan. The interference is gone and my

PC is cooler.

Thanks for the ideas!

My problem is I had to disassemble the radio so far to get to the back
of the lamps, I can't run it to check the voltage. The lamps are
driven by an automatic dimmer circuit, so can't just trace the source.
Would like to see a data sheet on the lamps, but doesn't seem to be
available. I saw one reference to Intersil as the manufacturer, but
it's not listed on their website.

Tom, you are making this waaaay too complicated. Just solder up a
ground plane on an SO-239, hook a coax to it and start transmitting.
You don't even need welding rod. I have used coat hanger wire in the
past. Forget about baluns, beads and inductive coupling. We're not
launching a spacecraft here. Keep it simple.

If you look at the schematic, you will see that there is 11.5v supplied
to the lamps for the display, ANY grain of wheat lamp rated for 12-15v
will work. Radio shack does sell them, most older Icoms IC229H ect use them.

In the sevice manual, the junction of R77-R78-Q12 is 11.5v and this goes
out to the lamps.

My new plastic sided (gamer?) 2.8 GHz PC causes not a single problem here in the shack. My older 400 MHz Celeron however totally trashes 80 meters and is only tolerable on 40 meters, everything else is fine. Go figure.

Sam

I had a similar problem with a new computer system I recently built up.
Problem was a noisy 350W Power Supply.

I replaced it and the machine now is perfectly quiet. A good solution
for a few bucks. It is very hard to shield a computer from this sort of
noise as it radiates from the leads in addition to directly from the case

Well letsee.......Popular Electronics Mag (no longer in business) published an AM transmitter article for use on the BCB. It was housed in a steel mail box along with the antenna network and antenna out the top of it. It was meant to be mounted outside with the power and audio remotely fed to it. Letsee that article was published in 1962 as I recall........As a broadcast engineer I would be really critical of what the "Bells and whistles" were.

Any thoughts on this auction guys? It's an expensive mic being auctioned for
next to nothing.

Untested as-is - do these things break frequently or is it a good bet it
still works?

1466. Anybody find the W&W battery packs are not so hot lately??????????

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-19 17:37:40 UTC
From: Sky King <SkyKing5@optonline.net>
Message-ID: <423C6364.7060109@optonline.net>
Source record: 16439
Cross-posted to: rec.radio.amateur.equipment,rec.ham-radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.swap,alt.ham-radio.vhf-uhf,alt.radio.scanner,rec.radio.scanner,rec.radio.swap

Hi all, the last FEW battery packs and inserts I have purchased
within the last year from W&W battery seem not to be cracked up to their
usual high standards. About 8 months ago I ordered a battery insert for an
Alinco DJ-580T. W&W says that they use Sanyo or Panasonic cells. If
other brands
are used they will say so. Anyway, when I received the insert they were
green
batteries with no brand name on them. They didn't say Sanyo or
Panasonic like they
said in the past. Also the batteries had 1100 stamped into each
battery. The W&W sticker
says 12V @ 1200. I called them at the time and was told don't worry
about the 1100, it means
nothing. I said to myself ??? !!!
I few months earlier I purchased a NI-Cad pack for my FT-50. I can't
see into it but it never took a full charge, even
after a few weeks of proper cycling.
I have a buddy who has this expensive battery analyzer where he works,
I'm told the charger is a professional
charger and costs around $3500 dollars, its gotta be some gizmo.
Anyway, It did not perform well. I called
W&W and told them and they replaced the pack, which is a great thing
for them to do in the name of customer relations.
The one they sent me performed the same. About 3 months ago I needed
another pack for the FT-50 because the second
NiCad pack went bad.
I pickup up a NiMH battery this time at the local hamfest. This battery
is the same deal. Never
gets a full charge. I have used W&W fast charger, my Yeasu charger and
a MaHa charger on these
batteries. After I use them for many cycles it is the same. My buddy
put this one on his
expensive analyzer and the best it will do is 70 percent. WHAT
GIVES???? This is a 9.6V @1100MaH and
it acts like a 600ma nicad. I use these HT's to receive 98% of the time
since they are used mostly at work.
I have the same damn problem with a pack for my FT-530.
I have been very happy with W&W over the last 15 or so years. I don't
know what is going on other than
using cheaper batteries and charging for the higher priced good batteries.
BTW, that Alinco battery insert does not hold a great charge and has a
cell going bad. My batteries usually

last for about 2 years or so. Not any of these. I have had many HT's
over the years and I'm knowable of batteries
and the different types and charging habits. If I only had one charger
I'd suspect that, but with all the chargers I own
and with my buddys charger at work, I know it's not me or my equipment,
it's the batteries.
Any comments from people finding the same results??

Hi all, BLAH BLAH BLAH.....

Try buying a real **OEM** QUALITY battery!!! Yeah I know it costs a little more, but money is not everything.....
The differance in price is minimal, compared to the lack of service...save your bucks a little longer and get the GOOD battery.

From the Ebay listing:

"This Stereo Microphone sure looks & measures like this Audio Technica model
AT835ST.

Best of all, it's LIKE-NEW:-)

There are no labels other then the one shown. I measured & weighted it & its
exactly like the spec sheet."

So, the question is, is it an AT835ST, or not?

Broadcast Engineer? I started in that field in 1973 and have worked
in TV and AM radio until last year. It was awarded as a civilian
acquired skill when I was drafted in '72. I have worked up to a 5 MW
ERP UHF TV site with a 1749 foot tower. I started with '40s tube
equipment and worked up to state of the art RF and studio sites. I like
a good design, but then I got spoiled working on $80,000 radios and
building multi-million dollar telemetry receiving systems. I don't need
another transmitter around but I would probably build one with a MC1496,
or one of the newer Analog Devices four quadrant multiplier chips if I
changed my mind..

1478. Re: Anyone pull COS off an ADI?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-20 03:26:49 UTC
From: Jimmy Mac <no-spam@manicarcade.com>
Message-ID: <Z36%d.11555$m31.121199@typhoon.sonic.net>
Source record: 16351

Well I did it..

I simply took the time with an old analog VM and I found exactly what I was looking for..

On the ADI AR-247, I was able to locate both COS Hi and COS Low.

Pins 10 (SQ) & 12 (SM) on CN4 will provide Active Low and Active High respectively.
It's only about 4 Volts on my meter but that's more than enough to trigger my IRLP v3 card.

I simply pulled my COS from the leg of VR1 for my active high.

J..

Source record: 16356

Rob, on my 730 theres a provision for a 12 volt back up
plug on the back. when voltage is maintianed your vfo will
remain on freq when the rig is shutdown. when there is no
voltage on that plug, the vfo will reset back to the
beginning of any band you selected. Its kinda of a
hassle, but no internal batteries to mess with. One of
the few icom rigs with a quadruple conversion on the
reciever circuitry.
Excellent radio for the money.

gud luck, steve in tx.....

Hi Micheal, I guess after doing the real thing a .1 watt transmitter doesn't do much for me. I will say however that QRP is fun for me on HF thru 70CM. I remember once using a signal generator, modulating it and feeding a longwire. I heard it for about a 5 block radius. I called it KVOM (K voice of Milpitas) Calif. I picked a clear freq and went for it. Hmmmmmmm talk about coverage.....I live in Nashville and WSM covers real well. That big Blaw-Knox tower dominates the area along I-65. I can listen to WSM when in Birmingham AL during the day quite well on a car radio.

I played around with part 15 AM transmitters when I while I was in
high school and helped start the school's ham radio club. The call was
WDSC, for my girlfriend's initials. I was always more interested in
receiver design and construction than getting on the air. I'm the kind
of guy who loses interest in a project after its working properly so i
was always looking for the next project. I started in broadcast while
in the US Army in the early '70s at Ft Greely AK. We had a Gates BC250
on 980 KHz at 250 Watts and a 500 Watt Ch 8 Gates TV transmitter.

Lucky you! WSM is my favorite station and I've always wanted to go to
the Opry but I'm disabled now and I don't know if I'll ever get the
chance. I saw the WLW tower and 500 KW transmitter in the late '60s,
along with the old VOA plant at Bethany (Mason) Ohio. I got to look
inside the beast and talk to an engineer who was a young man when they
were still using the transmitter.

I can pick up WSM her near Ocala, with a Sony walkman, (SRF-49) that
runs on a single AA cell. It doesn't have any speakers so I plugged in
a set of non amplified computer speakers and use it on my night stand to
listen to WSM while I'm laying in bed. I have broadband so I can listen
to their stream, when it works.

I have had several local hams try to get me to get my ticket to play
with ATV but I'm kind of burnt out on TV these days.

WHAT IS ARMAD ?

http://www.freewebs.com/kb9ibw/

ARMAD is an annual Amateur Radio Special Event project that stands for Amateur Radio Military Appreciation Day. We work with National Military Appreciation Month during the month of May. Amateur Radio Operators from around the world team up during this joint effort to allow the people from our communities to gather at public locations such as shopping centers, parks, VA hospitals, and sporting events to express verbal positive support "LIVE" over the radio for members of the Military, Veterans, Reserves, National Guard, and military support groups. It is also a chance for those at each location to hear and exchange messages of appreciation with each other over the radio. Many of us have friends, relatives, and neighbors that are active duty, and past members of the armed forces. ARMAD gives us the chance to support one another, and to express our thanks and appreciation to those that sacrifice and serve in the Armed Forces.

I do not any more; Motorola seems to use whatever cells are available
on the market, while aftermarket suppliers often use Sanyo cells -
these batteries are cheaper, and at least the same quality as the
original ones, often better.

regards - Ralph

You probably have some electric lines that are arcing nearby. If you have access to a portable HF receiver, you may be able to trace down which pole it is. You may try taking a large hammer and hitting the suspected pole and see if the level of the noise changes.

When its dry, the connection on the pole is not making a good contact and is arcing. When the weather is wet, the humidity in the air is making for a better contact.

The same could apply to your ground connection. Bad when its dry - good in
the damp.

Bad advise!! Do NOT hit a power pole with a sledge hammer. Never!

If something is loose or broken on the pole, it could fall on you,
injuring or killing you. I once had a lineman replace a defective
transformer switch which was causing interference. All he did was
touch it with his hot stick, there was a blue flash and about 5 or 6
people lost power. Fragments of the defective switch fell to the
ground. Same thing could happen with cracked insulators or defective
lightning arrestors. And banging on poles will usually prove nothing
if a lightning arrestor is bad.

If a connection is ready to come apart, hitting the pole could cause a
power outage to one or several customers. Some older type bolt-on
bails are hanging on by a thread after years of rusting away.

Some power companies (including the one I work for) will prosecute if
you are caught hitting their equipment. If you suspect a problem on a
pole, write down any identifying numbers on the pole and call the
local power company.

1508. FA ParagonII and Henry 2KD-2 amp like Collins

Newsgroup: rec.radio.amateur.equipment

Have you tried a CPU reset as per the manual? CPU may be in a funny state.
After that I could only suggest checking that the PLL reference is working
(21.25MHz in to Q2008) and that the PLL chip's inputs look 'reasonable' (ie.
data gets shifted in when appropriate). Check also that the PLL Unlock
signal is getting from TP2007 to the CPU.

Cheers.

Ken

Thanks Ken. I did reset but no luck. I'll check for the 21.25 MHz signal.

Ken

Yes I used to work for the company many years ago the main transistors
were:-

OC171 the 4 lead type.
OC71 (I think)
And OC81 for the main amp. (if my memory is correct that is)
The Mk II had a 470 Khz trap on the front end.
The IF stages were double tuned at 470Khz
And a filter at 1000Khz for the audio. At least thats what I remember
of the Mk II.

The BFO was rubbish to say the least.
I found it hard to resolve many signals that were to strong.

If you scrapped the paint of the plastic type OC71 you then had the
equivalent of an OCP71 phototransistor
which IIRC were at least 4x the cost of an OC71 ! Bargain !

nostalgia ain't what it used to be.....

Tired of trying to use your older software on those new Windows XP, USB and fast computers?

This laptop is speedy enough to play on the net and run most applications yet compatable with you older Motorola Software. Have those "Error 2003" With you Maxtrac program? Solve it right here.

Available:

Toshiba Tecra 8000 Laptop
This unit comes pre-loaded with Windows 98 (for your Motorola Programming)AND Windows XP Professional Edition

366 Mhz Intel Pentium Processor
128 Mb RAM
6.2 Gb Hard Drive
2 PCMCIA Card Slots
Li-Ion Battery
Built in 24X CD ROM
Stereo Sound
USB Port
9 Pin Com Port
15 Pin RGB Video port
Infrared Port
6.5 Lbs.
Windows 98
14.1 Color Bright Display
Power Supply

This laptop is also loaded with the following software:

Windows 98 Operating System w/

Quicken Home & Business 2005

Internet Explorer Ver 6.0

Laplink Gold 11.5 (No Cable included)

Microsoft Office which includes:
Microsoft Access, Microsoft Word, Microsoft Excel, Microsoft FrontPage, Microsoft Outlook, Microsoft Powerpoint

PowerQuest Partition Magic Ver. 8.0

Astro Portables V 05.00.01
Astro Mobiles V 05.00.05
Astro Saber V 05.00.01

I just finished looking at the Tentec Orion, and I thought it was
ugly. I did not care for the Icom computer screen radios, or the
Kenwood orange LCD screen radios either. I want real knobs to turn,
real buttons to push, and a real analog meter to look at.
I sit in front of a computer all day at work. I don't want to look
at another computer screen when I get home and turn on my ham radio.
Am I the only one that thinks a radio should look like a radio, and
not an over sized Palm Pilot with a mic jack and a coax connector?

Fortunately, there are plenty of radios available to meet your
criteria. Should be able to pick up a Johnson Viking II and a
Hallicrafters SX-100 on Ebay. Lots of knobs and real meters.

If I'm going to run a piece of equipment from a computer I'd rather
do it from a real computer and not even see the other parts of the
system.

I worked on a $80,000 telemetry receiving system that ran under
Embedded Windows NT. A real pain in the ass to install the software and
set the radios up on the production floor.

I don't mind the computer displays, but I don't like having to follow
a menu several levels deep to set the controls I should be able to set
with the knobs. On the Icom 706, my biggest gripe is not being able
to set the display light level without having to turn off the rig
twice.

On the 706, i would much rather the Initial Set menu only set defaults
that will reset when I turn the rig off, but allow all the options be
available while the rig is turned on, if I want to change them.
Occasionally, I want to turn up the display light for a short while.
It makes no sense to me that I have to turn the rig off to turn the
light up so I can read the dial.

1542. Icom 706 MkII G Finals

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-24 18:15:37 UTC
From: WA9FVP <willco788@ameritech.net>
Message-ID: <1111688137.447714.186090@f14g2000cwb.googlegroups.com>
Source record: 16315

About two weeks ago I posted an article on e-ham.net
that I snipped from mods.dk about the 706mkIIg finals
being obsolete.

I did some investigating and determined that Icom is
replacing the SRFJ7044 power FET with the RD70HVF, the
same power FET that's used in the Icom IC-2720 dual band.
If you check the product reviews in eHam.net under;

Transceivers: VHF/UHF Base/Mobile (non hand-held)/
ICOM IC-2720H

You will see several complaints about finals burning
out in the IC-2720.

In one of the threads a ham complained that the final transistor
in his two week old IC-2720 caught on fire and damaged the radio
beyond repair. Icom replaced it. The 706 Mk2G uses 3 RD70HVF
power FET's (two for HF and 1 for VHF/UHF. The finals were changed
during production in the MK2G about 2 years ago.

I hope that Icom isn't using the same finals in the
IC706MKIIG that are causing problems in IC-2720!! :-(

Here a repeat of the mods.dk article.
---------Snip--------

The 706MKIIG radio has 2 different versions of the PA
board. The older PA board's finals (1590002690)aka
(srfj7044) are no longer available and would require
replacement of the PA board. The newer style PA board
transistors are part# 1560001190 (rd70HVF) and can be
ordered by The 2 styles of transistors are not
interchangeable.

The complete PA board is part# 98413600 and sells for
apx $442. The catch 22 is that this board is the old
style board, with the old transistors. We do not have
the new style boards available yet so, if the finals
fail again, it's another board replacement.

1546. Yaesu VX-2R memory and battery question

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-25 02:30:36 UTC
From: "Bruce W.1" <no@email.com>
Message-ID: <gJK0e.10668$ZB6.3555@newssvr19.news.prodigy.com>
Source record: 16319

I had a few hundred frequencies stored in the memory of my Yaesu VX-2R. The battery pack died and remained that way for probably a month or two. Now all of my memory data is gone. Apparently this is volatile memory.

I store this HT in the refrigerator with a battery installed. This is where I store all of my batteries. Every six months or so I check the charge level on all of the batteries.

Whatsmore, it seems that this HT pulls a small amount of current from the 1 Ah Li-ion battery even when shut off. I say this because none of my other Li-ion batteries in the refrigerator were anywhere near dead. The VX-2R battery was dead as a doorknob, so I replaced it.

My queston is, what sort of internal battery maintains the VX-2R memory? And how long will it last without the main battery? Might my internal battery now be dead? If the internal battery is also Li-ion then it's probably best to not store it in the refrigerator if there is a small load.

I'd hate to reprogram this thing only to lose all the data once again.

Thanks for your help.

Bruce AF8F

Gee maybe being cold doesn't help the situation..... Don't let the
battery go dead, USE it once and a while. What did you do buy it to keep it
on ice??

1550. Best HT value?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-25 04:16:30 UTC
From: John Harlow <johnharlow@gmail.com>
Message-ID: <mu-dnf-ONb2IDN7fRVn-jw@comcast.com>
Source record: 16323

I'm looking at a Kenwood TH-F6A and an Icom IC-T90A. I think the Kenwood is a bit better but of course $50 more.

Is there a better choice I might be overlooking?

P.S. I'd really like to find an airband TX as I'm a pilot too...

1551. Re: Audia-Technica AT835ST Stereo Shotgun Mike $12:-(

Newsgroup: rec.radio.amateur.equipment

They came from a studio that closed down, locally.
Sold 4 mikes so far, 2-AT835ST & 2-AT815ST, no problems & no complaints
either. I am not a Stereo head but they were quickly tested & are fine.
Matter of fact, they went for over $225 & not as nice as this one.
If you look at the audia-techinca mikes on line, even they have no tags that
I can see, only a white tag to show the positions of the little slide
switch's!
What more can I say to you Doubters?

No thanks, the last transmitter I took care of was a 130 KW Comark UHF TV transmitter with the antenna on a 1749 foot tower and it had a 5 MW ERP from Orange City, Florida. I prefer working on high end receivers and their design problems but I had to leave the business due to health problems. This was my last project: http://www.l-3com.com/te/PDF/Microdyne/RCB-2000.pdf I worked as an engineering tech to help move it from hand built prototypes to the production floor.
It sold for about $80,000 when I left Microdyne.

>
> Bruce AF8F

It probably doesn't have an internal battery but more likely a 1F capacitor or similar, so you will need to keep the batteries charged (for this you must remove it from the fridge) or the memory cap may go flat in a week or two. Once the battery pack is charged, it may also take a few days for the memory cap to fully recharge too.

Couldn't you find a bigger room for your shack?

Nana

I just got the rig all set up a few minutes ago with a vertical groundplane --- a design I chose because it obviated the need for any kind of matching due to it's intrinsic, unbalanced 50 ohms impedance. Works like a charm too, thanks to everyone for all the excellent advice, its very much appreciated.

I would like it to be in the menus while in operation. I know it
would add depth to the menu, but i find it ridiculous that I have to
turn the rig off when I want a brightener display or not. I usually
leave it on dim but there are times I prefer the display light off and
then on when I want to use it. and back off again. However, i
recently ran across a situation where I wanted to brighten it for a
short while. If I am in QSO, I don't want to turn the rig off and on
again. I can't hear very well with the receiver turned off.

Yaesu makes (or at least made at one time) the VXA-700 which is 2
meter & airband, it shows up on the AES site but not on the Yaesu site
.... isn't a bargain either at $420!
AES: http://www.aesham.com/index.html

As to the TH-F6 it is a decent handheld, though don't expect much from
the HF receive. It does allow you to monitor two bands at a time and
that can be a plus - not familiar with the Icom to offer any useful
comments. Also, the TH-F6 it is a bit more prone to intermod than
either the Yaesu FT-50 that I used to use (and keep as a backup).
It is hard to compare the Kenwood and Icom in that the former offers
220 mHz and the later 6 meters - not quite apples to apples
comparison. Given that difference, I'd look at which of those 2 bands
(6 meters vs 220 mHz) has more activity in your area and let that
drive your choice. I've owned & used products from Kenwood, Yaesu and
Icom and have been satisfied with all - each one does have it's own
quirks in regard to how they get programmed, default step sizes etc.

Hope that provides some help,
Howard

Gee, I'm still using an FT-530. I have replaced the knobs, antenna and about 4 battery packs (all still available) and did some maint on it. It was a good deal at roughly $230 just before being discontinued. They are probably very cheap now and have the neat feature of not having to sharpen your lil' pinkie to use the keypad. Speaker is kind of small (aren't they all now) but if that's a problem, get a big commercial HT.

Years ago, real hams made bids on old HT-200s and rebuilt them to get on the air. The really fortunate found HT-220's in good condition. My first "HT" was a packset that required several batteries to power the tube transmitter. After replacing the Transmitter strip with a VHF Engineering kit board, it could go anywhere and go weeks on a set of batteries. There was even room for extra pencils, paper and Logbooks in the battery tray.

I would suggest for starters, join ARRL and check out the QST product reviews on their website:
http://www.arrl.org/tis/ and look at the many ham ads.

PS You wont find airband TX anywhere in a ham radio. If you NEED an airband radio, get one. You don't scrimp on AV gas do you? There may be some that will work in the ham band. There are portable Airband radios that will do everything from GPS to ILS.

==========

You're probably right about the capacitor.

This radio has 1300 memories. Rather than go thru its conventional
programming process again I decided to make an interface cable to my PC
and program it with Commander software:
http://www.kc8unj.com/index.html

Thanks.

I worked around a 5 MW ERP TV station, No heat problems working on the 130 KW Comark transmitter but it was a royal pain to flush the cooling system and refill the antifreeze every year. Truck loads of distilled bottled water in five gallon bottles because the well water at the site was so hard. We used a cleaner called Tyglos (sp) to remove any scaling from the plumbing but we had to keep it out of the three 65 KW Klystrons. We had to drain the system, disconnect the tubes and bypass them then flush the system. I bought some fiberglass duct board to put around the heat exchanger and used a "Salamander" heater to bring the system up to normal temperature so the cleaner would work.

I have a National NC-183R on the bench right now to rebuild. Its a better radio than either of the Radio Shack DX-300 or DX-375 radios but I can't use it when the power lines are down after a hurricane. So, I keep the DX-375 and a Sony SRF-49 around for the hurricane season.

1567. Part for Motorola Deviation Meter Solved! 85L52

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-25 19:05:20 UTC
From: WA9FVP <willco788@ameritech.net>
Message-ID: <1111777520.089600.57110@z14g2000cwz.googlegroups.com>
Source record: 16339

For more than a year I was searching the Internat for an obsolete IC that's used in a Motorola S1344AAB Frequency Counter/Auto Tune Deviation Meter. The Motorola part number 51-80329A60 is actually a DM85L52 manufactuerd by National Semiconductor (the IC is stamped 528 055178). I was able to get the data sheet from a friend that had an old NS data book from the early 80's. The part is a decade counter/latch with tristate outputs and will cause readout or counting problems or an incorrect frequency display. The counter also uses a DM85L51 that crosses to a 74LS173.

In the early 70's the unit was Manufactured by Systron Donner for Motorola. Systron Donner's model number was SLN6407A-75. They also manufactured a frequency counter model 6252 that's identical to the counter section of the 1344AAB. Other SD frequency counters, like the 6250 or 6202 use the same part.

If your looking for that part and you don't want to spend hundreds of dollars buying a minimum quantity from a surplus dealer, Look for any of the above SD models on Ebay. If your lucky and get one for about $25, cannibalize it for parts.

Here, here or hear, hear (never did know the right spelling for that)
but, hear,here...I too am too old and disabled to move from this
precious gulf coast, BUT, I won't have a green, or blue, or damn near
red LCD on any rig/receiver in my house when I'm found dead in it.

Butch said that

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have several Scsii hard drives, and a Scsii CD changer.
No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

no,

you are not alone. LCD displays and seemingly endless sub menus have kept me from purchasing newer gear.

the most hi tech piece of gear in the shack here is a kenwood ts-940 and a ts-711-a. other than that, it has tubes in it. one rig i regret selling is the kenwood ts-830. simplicity at it's finest. it's all on the front panel.

i have listened several times on 75 meters to people "tuning" the modern rigs. mostly, the yeasu ft-1000 whatever series. it must be my poor ears because i can not tell that much of a difference on ssb from the newer stuff to the older. kenwoods have always had great ssb audio. but if i am in the mood to listen to great audio, i tune in the 80 meter AM crowd and listen to them on my hammarlund receiver.

everyone's millage varies, i suppose. i had a chance to purchase a icom 756 pro for what i thought was a reasonable price. when i began researching the rig, i found that not only were the lcd screens prone to failure, you could not get replacement screens for them. too much of a crap shoot for me with people wanting 800 +/- for them.

i have several friends with lcd screen rigs. between the screen and the menus, i'd rather keep what i have.

I guess it depends if you want 220 or 6m. I went with the Yaesu FT-60.
2M, 440, 1000 channels $200.

I have a friend who is using a 2000 as a base right now. He can't turn off the PS without losing the memory. He hasn't had much luck finding the battery so he can replace it nor can he find a service or users manual.

That's fine, do you want to pay twice as much for a radio? Knobs,
buttons, switches, potentiometers, analog meters, gear- or
string-driven frequency readouts, huge faceplates of finely sculptured
aluminum, etecetera, all cost boucoup money.

On the other hand, a few function switches, encoders and software
devices with an LCD readout is a lot cheaper.

An alternative is to buy old stuff off Ebay -- of course, you'll need
to know how to work on radios if you go that route...

I have an old PCS3000 -- at least I think that's the model number.

In June 2003 we sold our house and moved into an apartment. Then, in Jan 2005 we moved from NE TN to the Mississippi Gulf Coast and are building a house. As a result, all my gear is in storage except for a FT-857D in my truck -- so -- I don't recall the Azden model number.

But -- I do recall replacing the battery. I just unsoldered the dead NiCad and soldered in one of like voltage. Sort of tight space to work in but that's all it took.

Source record: 16267

The thing is, look at the Icom brochures on the 2100, the 2200, and the V8000. The ONLY one that mentions stable even at high duty cycles is the 2100. Some have had trouble with the V8000 finals and there is only one review on the 2200 posted on www.eham.net, so it is hard to know if the 2200 is going to be a good one. I know Icom fixed the problem with the early 2100s and the newer ones have that fix. These are the ones that have the 133 mic, called the 2100H 25N. Even though that one is now being discontinued, I may just go with it. I had a V8000 recently that had RFI problems due to computers and I sent it back for a different rig. Not a good thing with computers in the shack and the cars these days.

And the neophyte asked...

Blue glow? I thought all vacuum tubes glowed orange at best. What's
happening to cause the tube to run so hot?

The PCS3000 did'nt have any Nicad inside it. It had a tiny
2 pin plug that you powered via your 12v dc supply which in turn
kept any of the freqcys you put in its 8 chnls in memory.
so we must be talkin about another AZDEN

According to my manual (and the empirical evidence, although I
have never replaced it): "The content of memory stored by the
user is backed up by the nickel-cadmium battery..." It's listed
elsewhere as being a 4.8V battery, so it's probably four cells.
They must have used a good one, too, as mine still holds a
charge as long as it is used regularly.

The old PCS3000 is a quirky rig, but it sure has a sensitive
front end, even after all these years.

Rob

Maybe it's not a 3000 -- I really don't recall -- all I know is that I unsoldered or cut the leads or somehow removed a NiCad similar to the ones used in early computers and replaced it with one that had longer leads so it would be easy to replace next time.

And they flickered as you talked because the current load on the power supply changed with the modulation -- sort of like an aurora display right there on the floor. On the floor because the power supply was too damn heavy to sit on the desk.

Modulation is a whole 'nother thread.

I just bought a compilation CD of even more Motorola software from a guy
on Ebay UK, it was nicely produced, even to the comment "This is for
your own use and not for resale - it must not be duplicated in any way"
Our local Motorola reps reply was not repeatable here!!!!!!!!!! This
was passed to their legal department and I've not seen the guy selling
anything since, Motorola or otherwise.

Message-ID: <42485f60$0$8741$db0fefd9@news.zen.co.uk>
Source record: 16287

Hi,

Can anyone help me? I seem to have fried the MOSFET that drives the UHF band (265 - 600MHz)receive circuit - I accidently transmited on 446Mhz with high power on my extended Tx modded HT. My TH-F7 is fine on the LF bands and on VHF but it is now very deaf on UHF - 430MHz. I have read elsewhere that the transistor can be replaced with a CF739 and I have managed to obtain a couple of these devices. My problem is - how do I locate this transistor?

Looking at the schematic it looks like Q62 is the device I need to change. Can anyone show me on a diagram or photo where this transistor is on the PCB? The TH-F6 and TH-F7 are basically the same so info for the TH-F6 will probably help me.

Many thanks in advance - I'm sure somebody must have this info but I have not managed to find it by myself.

Source record: 16293

If you have been looking for a very clean Ten Tec Paragon II station, here is a nice one. The station consists of the Paragon II transceiver with the AM and 2.4 SSB filters, the matching Ten Tec 962 Power Supply, and the Ten Tec 705 microphone. This equipment is in very fine shape and includes the original shipping boxes and the original manual for the Paragon II and the original factory brochure for the Paragon II.

The equipment is in very good cosmetic condition. There are a few very small scratches on the cabinets and trim rings, but nothing serious. The equipment works great. SSB audio is fantastic on receive, and I get great audio reports on SSB transmissions. It appears to meet all factory specifications. The transceiver operates on CW, SSB, AM, and FM. It puts out 100 watts. The equipment has been in a smoke free environment. I don't believe you will be disappointed in this gear. Digital pictures available upon request. Price is $1450 for the complete station plus shipping.

Thanks, Charlie Hugg

PK-232's are still used a lot.
For packet I use AGW with UIview (APRS) or Winpack (packet)

Other modes can be worked with http://www.cssincorp.com/pkterm/
The PK-232 can even, be upgraded with todays digital modes
http://www.timewave.com

Charlie;
One clarification should be made: the 6 Khz & 2.4 Khz filters were standard in the Paragon II; without the 2.4 filters the rig would not work!
GL from a long term Ten-Tec owner,
Jim

FYI, way over-priced. The Ten-Tec used/demo list from the factory has
used Omni VIs for less than you're asking for the older Paragon II

Source record: 16218

About two weeks ago I posted an article on e-ham.net
that I snipped from mods.dk about the 706mkIIg finals
being obsolete.

I did some investigating and determined that Icom is
replacing the SRFJ7044 power FET with the RD70HVF, the
same power FET that's used in the Icom IC-2720 dual band.
If you check the product reviews in eHam.net under;

Transceivers: VHF/UHF Base/Mobile (non hand-held)/
ICOM IC-2720H

You will see several complaints about finals burning
out in the IC-2720.

In one of the threads a ham complained that the final transistor
in his two week old IC-2720 caught on fire and damaged the radio
beyond repair. Icom replaced it. The 706 Mk2G uses 3 RD70HVF
power FET's (two for HF and 1 for VHF/UHF. The finals were changed
during production in the MK2G about 2 years ago.

I hope that Icom isn't using the same finals in the
IC706MKIIG that are causing problems in IC-2720!! :-(

Here a repeat of the mods.dk article.
---------Snip--------

The 706MKIIG radio has 2 different versions of the PA
board. The older PA board's finals (1590002690)aka
(srfj7044) are no longer available and would require
replacement of the PA board. The newer style PA board
transistors are part# 1560001190 (rd70HVF) and can be
ordered by The 2 styles of transistors are not
interchangeable.

The complete PA board is part# 98413600 and sells for
apx $442. The catch 22 is that this board is the old
style board, with the old transistors. We do not have
the new style boards available yet so, if the finals
fail again, it's another board replacement.

1646. TM-741A Problem

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-30 06:20:17 UTC
From: Chuck <w9bik@arrl.net>
Message-ID: <qtmdndVXxIvy29ffRVn-iA@comcast.com>
Source record: 16219

I have a TM-741A tribander with 50/144/450 modules installed. The unit was inactive for several years, but was working great at the time of last usage - no problems whatsoever.

I recently tried to put it back on the air and when I applied power and pressed the power switch "-on-" was displayed in the center of the display and the three band control LED's were lit red.

After that, pressing the power switch repeatedly had no effect -- the unit would not turn off until I shut off the power supply. No other switches or combination of switches had any effect. The only thing I can get to work is the display test (F+MHz+Power On) after shutting off the power supply, letting the unit sit un-powered for a while, then applying power and pressing that key combination.

While the display test is up, if the VFO switch is pressed the display test ends and a "0" appears in the band A area of the display. This remains until the unit is powered down and re-powered.

If the unit is powered down while the display is "-on-" and powered up again within a minute or so, the unit powers bacj up to the "-on-" display without touching the power on button.

I found the two solder-in lithium batteries to be dead. One battery is for the display unit, the other is for the control unit. I replaced both batteries with new Kenwood part numbered batteries, which now check good in-circuit. The symptoms described above did not change after replacing the batteries.

I'm stumped. I was looking for some sort of physical master reset switch on the control board, but found nothing. I tried all of the switch combinations listed for various memory reset functions with no change in symptoms. The service manual is of little help -- does not cover any troubleshooting or battery replacement procedures.

Anyone have any helpful thoughts (other than sending it to Kenwood for repair - my next step)???

Thanks
Chuck W9BIK

That depends on whether you want 60M and a general coverage receiver. Based
on recent
Paragon II prices, I'd say it was right in the ball park, especially since
the mike and
power supply are included. The II is a much more competent rig than the I.

Regards, N5EI

A recent used listing from the factory had a Paragon 785 at $795, and
Omni VIs from $1195 to $1695.

But hey, I'm not buying anyway; I'll go stick my nose someplace else
:-)

1651. Question on Kenwood TM-V7A computer interface

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-30 19:49:13 UTC
From: Roger Leone <raleoneTAKEOUT@sbcglobal.net>
Message-ID: <ZoD2e.8118$zl.7192@newssvr13.news.prodigy.com>
Source record: 16224

Thanks for reading this. My friend Keith KA6FEW built this interface:
http://www.mods.dk/view.php?ArticleId=2220

He is having trouble getting the PC to communicate with the radio. I don't own one of the radios and haven't tried it myself but he tends to come to me with his questions. If you have built this and got it to work, I would appreciate hearing from you. My first concern is this radio seems to have only a TNC port for packet operation. Does that port also allow data communication between radio and PC?

73,

Roger K6XQ

I built a somewhat similar circuit for use with a TM-G707A.

It did work, but was somewhat "quirky". I sometimes had to
power-cycle the radio two or three times, and/or connect and
disconnect the cable to the PC or the radio once or twice, to get the
radio to "see" that there was a serial interface connected. The radio
seemed somewhat sensitive to the ordering of power-on vs. having the
interface plugged in vs. having the RTS line asserted.

I switched over to Kenwood's own serial interface when my own quit
working entirely (I never did bother to tear it apart and figure out
why) and I've noticed that the same order-sensitivity seems to exist
to some extent with the Kenwood interface.

Now, as to the capabilities of this port: on the TM-G707A there are
at least four different features available:

- 1200-baud packet radio capability (audio input goes to the mic
circuit, I suspect).

- 9600-baud packet radio (audio input probably goes directly to the
modulator, bypassing the audio frequency shaping)

- One-wire bidirectional serial line (per this PG-4S interface) which
can be used to program the radio's memory and modes with the free
Kenwood software, or retrieve the memory/mode settings for editing
and storage. As far as I can tell, there's no general-purpose
radio control available via this line - you can't "remote control"
the radio operation via a PC - it's just for memory programming.

- Diagnostic/setup mode - shorting two of the pins together, holding
down a couple of buttons on the head, and powering the radio on
will put it into a service-setup mode which allows you to adjust a
number of internal parameters (e.g. deviation levels).

1653. 30' Tower For Sale CHEAP!!!!!!!!!!

Newsgroup: rec.radio.amateur.equipment
Date: 2005-03-30 22:58:48 UTC
From: respiratorytalk@yahoo.com
Message-ID: <1112223527.981083.206660@z14g2000cwz.googlegroups.com>
Source record: 16226

I'm selling a 30' aluminum tower...of course an added mast will make it taller.

It is in (3) 10' sections (M-13) (retail: $232.95 ea plus shipping)
It has a center tower mount to lock in a mast (CM-1300).(retail: $33.95 plus shipping)
It also has a hinged base system. (HB-13) (retail: $171.95 plus shipping)

Missing is the CHB-13 Footing Assembly which I had to leave at my old residence because it was sunk in concrete. I provider a Glen MArtin link so you can buy that part directly. I also provided the link to demonstate the bargain price I am offering this thing for.

I am asking $400.
You pickup. I'm in Little Falls, NJ.
It should fit into a pickup truck just fine.
Tower was shipped to me on a crate. I don't want to go through that trouble to ship it out.

This thing assembles pretty easy. Once the tower is together and wired, you basically walk it into it's upright position and screw on some big bolts to the hinge plate. I also have the bolts and washers.

Note: This tower got slightly damaged when I first received it. Apparently the fork of a lift truck banged into a could of cross sections. I removed some and replaced some. Tower is okay

Tower was initially purchased at...
www.glenmartin.com/catalog/page7.html

I can be contacted the quickest at

You are correct about the price of the 585. But that is a Paragon I. The
Paragon2 is a 586.
It costs substantially more because computer control , FM, and a number of
other options were
standard and built in.

This antenna went together in about an hour (I took my time) and it plays beautifully at 35ft with a 1.2:1 swr. I also have an M2 Horizontal Loop at 40ft and of course the beam out performs the omni loop but the loop is my main listening antenna for 2M SSB. Also have a Ringo Ranger II up at about 30ft for repeaters and fm mobiles. Pics of all 3 and tech data links at

Hi Charlie,

Good set of pictures. You used the night sky and the day's clouds to
good advantage to give contrast. The moon shot was a nice touch too.

I especially like using the last 4 inches of transmission line used as
mast.

Hi Richard,
That last 4 inches of line for a mast is history now. I had purchased a mast mounting kit from M2 but when I installed it I was unable to tune the loop down below about 2:1..so I put the mount away but the swr was erratic during weather and wind. So..I got the bracket back out and looked it over and "voila" I realized I had been mounting the antenna on it incorrectly. Now the bracket works like a charm and all is well.

Thanks. I had found that lamp in the Mouser catalog. However, the
last time I applied power to the IC-28H, one of the lamps came back to
life. When I observe it from the backside of the circuit board, the
lamp has a definite green glow. I assume this is what gives the green
look to the display. I read a message from one person who used amber
LED's to give it an amber display. This leads me to conclude that the
color of the lamp light is what determines the color of the display.
I have not seen any 7219 lamps on the Internet that are green. Still
looking.

How about using a standard bulb (as in the Mouser catalog) and giving
it a light coat of green nail polish? A light-green LED with series
dropping resistor might also give you the desired hue.

Have a mint NOS Mosley multi-band antenna STILL IN UN-OPENED CARTON*, TA-53M** (See Mosley site for all specs); lists for ~$803 + shipping + tax. Sale for $503 = $300 + tax total savings. * Note: hardware box did not survive the 'delivery service'though all the hardware items are still sealed in the large, clear, plastic 'sack' and the 12 coils are in great shape. I will rebox for shipment. Antenna box, ~6x6x7ft 3", is stamped at 41 lbs- though I have not checked this weight. You pay exact shipping via UPS or FedEx--no 'Handling' or 'extra packing' fees! I will have 2 digital pics by mid-day on 04-01-05 (not an April joke). You can pay via Pay Pal if you wish.
**4 element, 5 band, 600W-RTTY, 1.5kw-CW, 2.5KW-SSB; 14ft 2" OD boom.

Will try here before going to Ebay. Tnx heytubeguy, Joe

I got my answer back from Icom. Answers the question about the green
lamps.

Dick

Good Morning.....

Thanks for your e-mail.

The lamps are clear in color. The display color comes from the filter
that is behind the display. The stocking part number for the lamps
is: 5080000130. You can purchase them from our parts department.
Their e-mail address is: parts@icomamerica.com or you can telephone
them at: 425-454-8155. Hope this will help.

Best Regards;

Try this first:

They don't like to be unplugged. I have found by running the
internal vfo from end to end and programming to the memory then back
into ext a few times will unconfuse it.

When power is lost, the VFO forgets what model it's plugged into.
You can supply 3.5 - 5 v to the memory line with a cordless phone
battery to fix that. A diode across a limit resistor will keep the
battery trickle charged and keep the memory for a day.

If you can't get it to work I can take care of it in California and
do the mod.

I'll keep this simple.

I have a mobile radio mounted in my car. It's an Icom 207H 2m Mobile. I need to somehow (as easily, cheaply, and quickly reversible as possible) restrict the transmit distance to something quite short (say, between 50 and 200 feet, at the maximum). What's the best and easiest way to do this, while still keeping something that can be easily reversed?

Will simply running the radio on low power (5W) with no antenna do the trick, keeping in mind that the radio is inside a metal car? Or should I somehow shield the end of the coax and/or the body of the radio?

It will only be used to transmit in fairly short bursts, say 10 seconds max, and at the maximum one burst per hour or two.

Thanks,
A newbie,

J. Antman

A dummy load should suit that purpose.. even the best shielded ones should
have enough leakage to be heard that far.

Disconnect radio from antenna.

Connect radio to good-quality VHF-rated dummy load.

>Will simply running the radio on low power (5W) with no antenna do the
>trick, keeping in mind that the radio is inside a metal car?

It will quite possibly damage the radio's RF finals. Some radios have
good high-SWR protection, others do not. How lucky to you feel today?

Use a dummy load, and minimum transmit power. Enough RF will leak out
of the radio and coax to allow you to hear it tolerably well over
short distances, and it should pick up enough of whatever signal you
transmit from an HT to be able to receive well enough.

> Or should
>I somehow shield the end of the coax and/or the body of the radio?

terminate the end of the coax with a 50-ohm dummy load.

>Thanks,

There is a strong possibility that if you operate the rig with a dead
short or open for the antenna that you will kill the finals more
quickly than you think.

Use a dummy load and see if that helps. Additionally, you may get
enough 1 watt resistors to put in parallel to make up 50 ohms at 5 or
more watts. That will work well and not risk damage to your rig.

using the dummy load inside the car will probably still allow it to
ttransmit outside for quite a ways.

Good luck

Attach a good quality dummy load to the antenna connector, and
make sure your TX power is set at low. That should keep the emissions
down.

> Will simply running the radio on low power (5W) with no antenna do the

If you value your radio's transmitter stages, NEVER run it without
either an antenna or dummy load. Period.

Was that not covered in your ham radio license study material?

I have two Radios in as New Condition. Boxes, manuals, mics and power
cords
One is the Kenwood TS-2000 DSP rig that does it all. HF, 6m, 2m and
440. $1400.00
The other is also a HF mobile, Kenwood TS-50, less than 3 hours of use
only in the house. $500.00
Both purchaced new around last Christmas, I'm selling these for a
friend, both prices are firm plus shipping
Thank you, Chris

A brand new TS-2000 at http://www.gigaparts.com is now going for $1639
with $100 off, making it $1539... Doesn't seem like you're offering
that great a deal. Quite honestly, if they've been out of the box at
all, and buying from an unknown party, I'm guessing you'll have to
knock at least another $300 off the price of the TS-2000, and I don't
see the TS-50 as being all that attractive a deal either...

I agree. For those prices, a smart person would spend the little bit extra for a new one and get a WARRANTY. Without that, they aren't worth more than about two thirds the price of a new one no matter how good a condition they are in.

Thanks to everyone for the replies. It turns out that the whole thing no longer matters. The idea was to use the rig to activate a nearby relay, based off of an old, re-programmed Motorola Minitor-II two-tone paging reciever. However, I'm having some issues triggering the pager, so the project is scrapped.

Thanks to all for the advice. When I place my next order from one of the dealers, I'll buy a good dummy load in case I ever need it again.

Bruce - yes, I'm sure it was covered somewhere. But I was more worried about getting the numbers and formulas and physics for the test, and had no problem remembering the 'easy' stuff...when taking a test at least.

Based on what you're saying, I have a hunch what are you trying to do, is test the Minitor with a 2 meter rig? I am betting you were using a "PL" tone to try to open it up to receive. Not sure what you know about Minitor IIs, but there are probably no less than 2 reeds in it. A "single" tone, won't do it. And you couldn't possibly switch tones fast enough to make it work. It is milliseconds of a difference. If you'd like some help with the Minitor II, give me a yell privately. I repair them all the time.

I just got a SINAD Meter at a flea market; as usual no manual.

It's a model 1410 by GAW Co., Inc.

If someone is familiar with the controls could you give a brief
description on the adjustment of the front-panel controls:

1. Tuning
2. Balance
3. What response should I get in the SINAD position?

I ask this question, because I get no meter indication what so ever;
probably why it was for sale.

> 1. Tuning
> 2. Balance
> 3. What response should I get in the SINAD position?

A SINAD meter meters the difference between signal and noise
(gee, what a surprize).

Typically, these things have an audio input and a notch.
They measure the audio level before and after the notch.
The difference in levels between these two signals is the
signal to noise ratio or SINAD.

You use them with a RF signal generator to adjust receivers.
Modulate the signal generator with 1000Hz, 3kHz deviation
(did I mention SINAD is an FM thing?).

Assume that the 1000Hz signal is 20dB stronger than the background
noise. The complete signal has a level of X; the signal after the
notch has a level that will be 20 dB down (as it will only have
the background noise). The SINAD will be 20 dB.

Your box is adjustable; I suspect tuning sets the notch frequency,
balance sets the signal levels and SINAD is the signal level difference.

These are actually pretty useful devices if you want to squeeze
the last dB out of a receiver. If you don't have one, you can get by
by using a _good_ comms speaker and aim it directly at your ear,
then fiddle for minimal noise, reduce RF signal, fiddle receiver again, etc.
That's what I did before I got one and you can get reasonable close
this way too.

73,

Geert Jan PE1HZG

1707. Broadband HT antenna?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-05 05:48:12 UTC
From: "Bruce W.1" <no@email.com>
Message-ID: <wEp4e.15129$ZB6.13437@newssvr19.news.prodigy.com>
Source record: 16180

Does anyone make a telescoping HT antenna meant to operate (1/4 wave)
over a broad band of frequencies with marking for those frequencies?

Most HT's can be modified to operate outside the amateur bands, like on
GMRS, MURS, FRS, etc. But I don't like doing this without a proper antenna.

It would be simple enough to make a 1/4 wave telescoping antenna with
calibration marks for everything VHF and UHF, just extend it to the
right length. It would have an easy way to set it to the right length.
Does anyone make an antenna like this?

TNX,
Bruce AF8F

I've seen one or two such on a dealer's table at a local hamfest,
although I'm not sure that they come pre-marked - the package gave
instructions for the number of segments to collapse to achieve
resonance on 220 and 440. I think one was made by ADI and/or Premier
but I can't be sure.

>Most HT's can be modified to operate outside the amateur bands, like on
>GMRS, MURS, FRS, etc. But I don't like doing this without a proper antenna.

You really shouldn't do it (well, at least, not transmit) even _with_
a proper antenna. Very few, if any amateur-radio HTs are certificated
for transmission on those bands, and using an "opened-up" ham HT to
transmit (even if you have a suitable GMRS license) is a rules
violation which could cost you your amateur ticket.

FRS and GMRS have very strict technical rules about the frequency
accuracy of their oscillators due to the tight inter-channel spacings,
and it's likely that at least some ham HTs are too sloppy in design
(or too poorly calibrated) to hit the frequencies accurately.

I can agree with Dick... I have 2 such Radio Shack antennas. I use one for
my Service Monitor, the other is for any other test purpose I may have, NOT
for replacement for an H.T. A tad too heavy. They were heavy for like the
HTX 202, if you used it on one of the micro radios out now days, the thing
would be top heavy.

I agree. You run into the same problems that Public Safety radios have to deal with. That is, trying to operate over a wide range perhaps 150 -174 MHz with a high power radio. Certainly the 1/4 wave is the best you can do to avoid shutdown of the radio.

For Dual-band 2m/440 operation and in particular when operating MARS, a 1/4 wave 144 MHz antenna will provide a more satisfactory load at UHF as well, although with a compromised pattern on those frequencies.

One of the most frightening tests I performed with 2m/440 ham antennas was that they were extremely sharp in bandwidth and resulted in extreme SWR beyond -+ 2-3 MHz on either band.

Public safety personnel often don't understand how hams can have high performance dual band antennas and they can't. Some suspiciously consider a conspiracy. The simple answer lies in the frequency coordination of the repeater frequencies on both bands, and the narrow but coincidental sliver of frequencies we use for mobile operation.

If you have a telescopic whip you are blessed. Carry a tape measure and chart with you.

Of course there are other issues regarding MURS, GMRS and FRS that are completely awkward and you might as well carry a real FRS radio along with a Commercial radio with a bank devoted to the ham bands on your bat-belt.

I contest the mentality that says you should "open up" a ham radio for "emergency use only" because you compromise the emergency situation by not using a radio up to the task. You can use a "church-key" as a can opener, but if you are truly serious you will pack a can opener.

I for one take the easy way out on all bands, vhf hf etc.
Use "tuners". At least your protecting whatever rigs ouput
you have. It does'nt speak to efficiency that way, but I get
rather good results with my G6 VHF antenna on all modes and
on MARS freqcys also which are out of the HAM band limits.
HF same thing. MFJ diferential T tuner with roller coil gets
me anywhere I want to go from 3.5 mhz on down to 30 mhz.

Why don't you get your own telescoping whip, attach it to a connector
for your radio, and using the formulas for frequency and antenna
lengh, mark the whip yourself? The only question is whether your handi
talkie input isn't already pre-configured strictly for the helio-wound
rubber duckie that comes with it.

For example, the rubber duckie that comes with my 2 meter Icom T2-H,
at 147 Mhz, has an swr of 3.0, and an impedance of just under 400
ohms, according to my MFJ 269 antenna analyzer. But the antenna works
fine on the handie talkie.

1724. FT-857 question

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-06 02:02:33 UTC
From: "Joe S." <nobody@nowhere.net>
Message-ID: <d2vfvs0go4@news4.newsguy.com>
Source record: 16197

A month ago I treated myself to a Yaesu FT-857D and ATAS-120 antenna. Installed the rig on my old truck -- I work the 0400 to 1300 shift at a building materials supplier 35 miles from home. I use the rig to chat on HF and VHF to and from work -- when the bands are dead, I SWL on the FT-857.

I am very pleased with the rig and can hardly wait to get my new house built and move out of this damn apartment into a place with real antennas.

Question for you FT-857 people: The main tuning dial has a really soft touch -- the slightest movement knocks it off freq. When I'm cruising along in an old truck at 0330 with my right hand resting on the gearshift, trying to tune the main tuning dial, it's tough to get a station tuned in. I guess I could change the tuning rate to the lowest possible, but, that's another problem. Is there any way to adjust the drag on the main tuning knob so it's a bit stiffer and so the knob doesn't move so readily? I think not but thought I'd ask.

Thanks.

You might want to try repeating the measurement with the MFJ 259 held
up beside your head as if it were an HT.

I've been told that HT duck antennas are often tweaked for best match
and lowest SWR when used in this position, with a significant amount
of capacitive coupling to the user's head. Measurements of a couple
of 'em with my 269 seemed to support this - they "read" a lot better
in a "typical HT use" position than they do if the analyzer is being
held out at arm's length.

==========

That's the part that's difficult to measure. Some of my good HT antennas that came with the radio, when tested alone on a good ground plane, have lousy SWR. Yet these radios are fully capable of being connected to an external antenna.

A perfect quarter wave is 36 ohms. Yet HT's are happy driving an external 50 ohm antenna.

I do have a few telescoping antennas. This might be the best solution. I was hoping someone made one built like a tape measure. A tiny SWR meter that mounted between the HT and antenna would be a nice solution.

I'll admit I like to have the ability to at least jump over to the FRS or the GMRS.

1733. Built-in TNC in portable transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-06 15:55:12 UTC
From: ixarka <ixarka@gmail.com>
Message-ID: <1112802912.408683.123810@l41g2000cwc.googlegroups.com>
Source record: 16106

Hey,

I'm fairly new to the whole ham arena, but a project I'm working on has necessitated the use of some ham hardware. I'm looking to build a portable ground station of sorts for talking with amateur satellites. Specifically, an amateur satellite that will be operating at 437 Mhz at 1200 baud. Basically, I'd like a mobile version of what's in the lab at my university (antenna on the roof, radio + TNC indoors).

I've been looking at some portable devices that fulfill these requirements (like the Kenwood THD7A(G) or Kenwood TM-D700). But, after talking to some people and reading some things on the web, I've come across literature that say that devices such as these, with build-in TNC's, aren't nearly as reliable as a radio hooked up to a laptop doing the TNC in software. Is this true? Are there any general issues that portable units with built-in TNC's have that I should be aware before I buy one?

The other option I have is to buy a radio and use a laptop to simulate the TNC in software. Does anyone have any experience with these portable units versus a laptop functioning as the TNC and hooked up to a radio?

Thanks and any advice would be much appreciated.

>external 50 ohm antenna.

Well, for one thing, the transmitter "sees" the total load - the
quarterwave's radiation resistance, the radiation resistance of
whatever is servicing as the ground plane / counterpoise / other half
of the dipole, and the losses of both. The role of GP/counterpoise is
usually taken by a combination of the HT's metal body, and the user's
skin (capacitively coupled to the HT body). The radiation resistance
and losses of the HT body and user's skin are difficult to predict,
and no doubt vary all over the place depending on the situation, sweat
levels, phase of moon, etc., but I imagine they're high enough to
boost the total feedpoint impedance up well above 36 ohms.

For another things, HT finals _have_ to be reasonably tolerant of poor
matches, or the failure rate would be astronomical - there's just too
much variation in antenna feedpoint impedance to allow such devices to
be designed with finicky, sensitive finals. I would guess that modern
HTs all use internally-ballasted multiple-emitter RF transistors which
are very conservatively rated (e.g. voltage breakdown ratings of
several times higher than the power supply voltage, plenty of excess
current-dissipation margin due to the ballasting) and may include
automatic high-SWR power foldback circuitry as well.

1737. Re: FT-857 question

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-06 17:43:32 UTC
From: JD <dixon@cae.ca>
Message-ID: <d31744$n0j$1@dns3.cae.ca>
Source record: 16110

Found it on www.ham.dmz.ro
"The tuning knob on the FT-857 free wheels too easily. If you prefer a tighter knob with more drag, here is what to do per a Vertex Standard Technicion.

Remove the rubber ring around the big tuning knob. Using an allen wrench, loosen the allen screw and remove the knob off it's shaft.

On the shaft you will now see a steel spring. This spring can either add tension or loosen the tension on the knob's shaft. To add more drag just tighten the spring's tension on the shaft. Do the opposite for making less tension on the knob. After you adjust to your likes, put the knob back on, tighten the allen screw, and put back on the rubber ring on knob."

Hope this helps

It's a Trio 9R-4J which Kenwood (Trio) built also for Lafayette. Lafayette sold the kit as the
model KT-200 and the assembled version as the HE-10. The set's tuning dial is copied from the
Hallicrafters S-38.

1744. Re: FT-857 question

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-07 04:38:44 UTC
From: Rick Frazier <rickf@rickfrazier.com>
Message-ID: <4254B9E3.9BC1D44D@rickfrazier.com>
Source record: 16117

Joe:

Why would you use the main tuning knob (the big one on the right) while mobile anyway? It's far too much trouble and takes your eyes off of the road (at least where I have the control head for mine mounted, at seat level just behind the gearshift in my Tacoma pickup).

I just set the rig for 1-khz and use the lower left hand knob on the rig. If you press the power button momentarily, it goes into "fast" mode (a little running guy sort of icon appears in the lower right hand corner of the display) and it moves 2-khz per indent. Only if someone is on a ham band and "between the slots" do I actually use the big tuning knob on the right.

Another thing to know. If you press the lower left knob in, the tuning moves to 1 Mhz per indent. This is useful for quick moves from one area to another if you are looking for swl that isn't near a standard ham band.

If you are using the ATAS-120, you'll find that swl receive is affected by the tuning of the antenna, just like transmitting. So long as you are close to the band you last tuned it's ok, but the farther away you get, the less sensitive the receiver will seem to be.

Also, check around the 'net and find the information on the "hidden menus" and write down all of the settings that you get for the factory settings. I've had several people indicate they've lost some of the settings from starting their car while the radio is operating (the input voltage drops below 12 volts and it does something to cause the settings to be lost). The most common complaint if this happens is a "mute receiver" or "dead receiver" because the sensitivity goes to pot.

Even knowing that, I routinely start my truck while the radio is on, and have never had a problem (but I live in Hawaii, and the temperature here doesn't drop all that low unless you drive up to the top of the mountain, so battery capacity isn't all that much of an issue compared to living in the great white north...)

I really like my 857, it's going on 16 months old now, and still haven't exhaustively explored most of the menus because I use it mobile all of the time. I did give up the ATAS-120 though, because I kept breaking off the whips on overhanging branches, and got tired of re-soldering various connections due to high vibration where it was mounted.

Thanks
-_Rick

Hmm, maybe I don't have as much upstairs as I thought -- moving my
head towards the antenna doesn't do much -- but moving my hand towards
the antenna does affect things -- this is all highly approximate
measuring with the MFJ 269; guess it's a miracle these HTs work as
well as they do... touchy little devils to measure...

Icom IC-706MKIIG w/FL223 SSB filter, and remote installation kit.
Never mobile, non-smoker, no mods!!! Like the day it came out of the box.
$850.00 shipped! Cont. US Only. USPS money orders only.

Icom R1 handheld comm. receiver in mint condition with original box, manual,
charger and good internal battery. 100khz-1.3ghz no gaps.
$150.00 plus shipping.

Cushcraft AR-6 6 meter base antenna. I believe it is around 3db gain.
$40.00

Diamond X510MA 144/440mhz dual-band base antenna. 8.6db gain
VHF/11.4db gain UHF. $125.00
(Both antenna's won't be taken down until it warms up. They are still
in use at the moment. These are for pickup only.)

All equipment is shipped in cont. US only. USPS money orders only.

I know on the 817 (the 857's little brother) there's a lock button that
can be used to disable the main tuning knob. Might there be such a
critter on the 857's control panel?

Many so called techs don't even know how to use them. You might find
out in a class. They are most used in verifying specifications. You
don't know how many experts have been unable to show me.

There should be no need for adjustment of the meter itself unless you
want to screw it up. If you don't know how to use it there won't be
an indication.

General instructions are available in Publication EIA/TIA-204-D

> >
>

Unlike some of the "automatic" sinad meters such as the Helper sinadder the 1410 has to be adjusted by the user. Set the signal generator to a very high output (enough to insusre a full dead quiting signal on a FM receiver) . Then crank in about 4 KC of deviation of a 1 khz tone (assuming a 5 kc receiver) , The Tuning and Balance are adjusted for the best null, meter to the left or 0 side. The signal generator is then lowered into the low microvolt area tuil the meter reads -12 on the red scale if 12 dv is the desired sinad point. You then read off the scale on the generator to find the 12 db sinad point.

Checkout http://www.monitor.co.uk/ . I just discovered it, appears to be very new. Well organized, clean, clear photos, graphics, descriptions of why and how-to for modifications to the Radio Shack/Tandy DX-394 General Coverage Communications Receiver. Also has PDFs of manuals and schematic.

Along with the 850 plus member user group at http://groups.yahoo.com/group/RADIOSHACKDX394/ and the collection of mods at http://www.mods.dk/view.php?ModelId=573, this new site helps make the DX-394 the most thoroughly hacked, researched and documented radio in the world.

Not according to reputable reviewers:

1. Radio Netherlands Receiver Test Laboratory Review of the DX-394
by Jonathan Marks & Tom Sundstrom - 4 out of 5 star "Value Rating"
http://www.rnw.nl/realradio/dx394.html

2. QST Magazine review of DX-394A et al from 1997
PDF file of review of DX-394 and Drake SW1 sub-$300 receivers and Yaesu
FT-920 MF/HF/6 Meter Transceiver
http://hamradio.online.ru/ftp/pr9710.pdf

3. Kurzwellenempf&#65533;nger Realistic DX 394
http://www.dr-boesch.ch/radio/realistic-dx394-test3.htm (German)
http://tools.search.yahoo.com/language/translation/translatedPage.php?tt=url&text=http%3a//www.dr-boesch.ch/radio/realistic-dx394-test3.htm&lp=de_en&.intl=us
(English machine translation - it's a hoot to read!)

4. eHam.net Reviews - Radio Shack DX-394
Collection of reviews by owners under Receivers: General Coverage. Average
3.8 out of 5.
http://www.eham.net/reviews/detail/2108

5. DXing.com Modern Shortwave Receiver Survey
DX-394 is below the DX-302 on the same page. Rating was increased from 1H to
3H about Jan 28/2004.
http://www.dxing.com/rx/dx302.htm

6. Passport to World Band Radio Review
1997 review from PWBR concludes: "Overall, the Radio Shack/Realistic DX-394
is a decent receiver for relatively little money. But it's no barn burner. "
http://groups.yahoo.com/group/RADIOSHACKDX394/files/Reviews/

One person's junk is another's treasure.

Correction: the rating was increased about Jan 28/2005, not 2004, correcting an obvious mistake. This longstanding, unsubstantiated 1H rating on DXing.com probably adversely affected the opinions of some uninformed individuals.

I have owned one in the past, it had one with the K-Filters in and it was
still the biggest load of rubbish I ever had the misfortune to own.
They are nothing more than a childs toy. Get yourself a decent receiver for
gods sake, even those cheap Tecsun things blow the dx394 away on EVERYTHING,
Man they are a joke.!

They sure do, Frank! I sent the webmaster a message complimenting him on his work with the comment that the one thing missing was credit to the inventors of the mods, "from the pioneering Frank Cathell to whoever had developed these new ones I had never seen before". I have no idea who is behind the site and whether it's motivated by anything other than enthusiasm to share what he/she has done. It's first class, all the way.

Not according to DXing.com who gave it 3: " A rating of 1 to 5 stars for the
model as a value on the used market.
HHHHH Excellent HHHH Very Good HHH Good HH Fair H Poor. "

That Panasonic RF-4900 you sold for ?85.90 is rated by the same folks at 2
(HH) - that's closer to crap, but still 'Fair'. On Mar 30, you posted that
you wanted to swap it for a DX-394
http://groups.google.ca/groups?q=rogers.mail%40ntlworld.com&start=10&hl=en&lr=&selm=hZz2e.826%24wQ2.632%
40newsfe5-gui.ntli.net&rnum=12 .
Sounds like an upgrade from a 'Fair' to a 'Good' value radio and
inconsistent with your expressed opinion.

The Kenwood R-2000 you were selling off in 2003 is rated at 4 (HHHH) by
DXing.com. That's 1H more than the DX-394 and it sells for 2-3 times the
price on the used market. Just a little less crappy, was it? ;-)

73, Tom

Never run into this problem before, I have a nicad charger that Ive used
for years and it charges AAA, AA, C, D, and 9 volt. Great little box.
Now I just received a pack of Ni-MH AA size and need to know if my nicad
charger will be ok to charge them? Will I do damage to the NiMHs?

As I understand it: NiMH batteries do "prefer" a somewhat different
charging regime than NiCd batteries - they're less tolerant of being
overcharged.

A NiCd "smart" charger will usually charge the batteries with a
constant current, and monitor the voltage across the battery. When
the batteries hit full charge, they begin to heat up, and the voltage
across them decreases somewhat. The charger will detect the voltage
drop (a "negative delta V") and shut off the charge. Fast chargers
usually include a temperature sensor, as well, and a failsafe timer.

NiMH batteries can be charged with a similar regime, but it's
apparently not a good idea to wait until the delta-V goes negative...
by that point the NiMH battery has heated up quite a bit, and that's
not good for its lifetime. A NiMH smart charger will cut off the
charge current when the voltage across the battery stops rising ("zero
delta V"), before the battery heats up very much.

NiCd batteries can be trickle-charged at a low rate, and I believe
I've read that this is not a good approach to use for NiMH batteries
(or, if you do it, the trickle current must be a good deal lower).

See if you can find the data sheet for the Maxim MAX712 and MAX713
charge controller chips - they have a lot of the details.

Message-ID: <425793A5.DD8F339A@rickfrazier.com>
Source record: 16059

Joe:

Several Iron Horse "hamsticks", one for each band I transmit on. As I generally run on 20 meters going uphill to work in the morning and 40 meters downhill to the QTH in the late afternoon (local net on 7.088 in Hawaii) and my trip is about 45 minutes each way, it isn't all that inconvenient. I've got an extension out the side of my trailer hitch mount that is just in front of the back bumper, with a pipe extending about 18" up to a spring and quick disconnect where the hamsticks connect. It took a bit of retuning when adding the riser, but the hamsticks seem to get a lower swr and slightly wider bandwidth this way, and I certainly get out with this setup.

This morning I heard a fellow in Germany on the way up to work (though there was such a pileup of high power stations I didn't have much chance to get to him before I had to start work), and routinely communicate with a number of mainland US stations without difficulty. Given that I haven't even bent one of the whips on the hamsticks, even though the tips aren't much below the level the ATAS tips were, I'm more than happy with the setup. I can't say the ATAS was a really bad antenna, just not optimum for my particular setup. I've got sticks from 75 meters to 10 meters, and get out pretty well on all of them (I haven't tried the 75 meters beyond the Hawaiian islands yet, but that'll come in a few weeks when I move, and probably won't have the QTH rig plumbed to an antenna for a couple of weeks after that.

Thanks
--Rick AH7H

IF you find a junked Heahtkit IM-18 (or earlier of this series) VTVM ... it
had a transformer with about those ratings.

A follow-up to my original post. I purchased the lamps from Mouser as was suggested earlier. I bought 10 because I couldn't see paying postage on $.58 worth of lamps. Now I have some spares.

As Ron said, the green comes from little, vinyl boots that the lamps fit into. Once you get the old lamps out, you just carefully peel the boots off. Replacing the lamps is easy as the pads are large and easy to solder to. The hard part is in taking the head off the radio. There are numerous plugs that have to come out so you can get access to the backside of the display PCB. Be careful when you unplug them as there are two sockets for several of them. You want to get the plugs back into the correct sockets. I'm back in business with full display lighting. Thanks everyone for the suggestions.

His only point is whether it is worth it to save $140 or so on a
second-hand rig from a total stranger that may or may not be working
properly and has no warranty.

No big deal.

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have several Scsii hard drives, and a Scsii CD changer.
No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

1797. Kenwood model 741 triband mobile: power-on problem

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-09 23:12:51 UTC
From: pawlwog@yahoo.ca
Message-ID: <b32b78e3.0504091512.75c89267@posting.google.com>
Source record: 16070

I have a Kenwood model 741 three band mobile with a strange problem.
If the power is interrupted momentarily it will not restart properly.
The word "on" appears and remains for about a minute before the rig
turns off automatically. Resetting the microprocessor and replacing
the two lithium backup batteries didn't help. However, if I
deliberately interrupt the power supply many times on and off while it
displays "on" it will ultimately, by chance, boot-up properly and work
perfectly until the next power interruption. I have $1500 CDN invested
in this rig and I would dearly love to fix it; does anyone have any
ideas?

:

Long term one needs to be on HF, thus at least a General class ham license.
VHF (2 meter ham), UHF (440 ham, GMRS/FRS) have their uses for local commo.
That is why the Army just purchased 20,000 ICOM F43G radios (440 MHZ) for
squad level commo. But the Army also purchased a lot of Harris HF radios as
well (AN/PRC-150).

Even SatCom has its uses. What one needs is all of it....

I really have to disagree with that. There is no way a 4-watt output
AM CB is going to communicate as far as a 50-watt output FM 2-meter
radio to a 5/8-wave antenna on the roof. In addition, if you are
talking about a real emergency, like a forest fire, where ARES/RACES
has been activated, the local hams will set up a portable repeater on
2-meters if the normal repeaters have been compromised. There is a
place for CB, and many have both, but it's not because CB has a
greater range simplex than does a good 2-meter radio setup.

Source record: 16075

I bought a one watt Ramsey FM transmitter to distribute whole house audio .... it's overkill, I admit, but better too much power than to little.

I don't don't know a ton about radio tech, so I thought I'd ask you geniuses for advice.

I am getting a wicked buzz from the transmitter. You can hear it plainly when I tune an FM receiver to the broadcast frequency when there is no music being broadast. I called Ramsey, but they weren't the most helpful (maybe because I'm so non-proficient in radio stuff).

Since my audio source was a computer, I considered the possibility that there was RF coming out of the PC, or that there was a PC related ground problem. So I tried using an iPod as the source, powered by battery.

And to get even more anal about it, I powered the transmitter itself from a car battery with the iPod attached.

Still the buzz. Arghhh.

Could it be my cabling? what is the absolute best way to insulate the cables? Where can I buy such superinsulated beasts? I need a stereo mini plug on one end and left/right rca jacks on the other.

I would be so grateful for advicce!

: oops.

You information on the ICOM program is out of date. The soldier intercom
has been replaced by the F43G

This is basically a 400 to 450 Mhz radio, with a more power than the FRS
radios that many of the troops are uing on their own. It is basically a
squad level radio, not meant for long range commo. However I do not think
that 20,000 is going to be enough.

BTW, you could purchase your own radio for about $400.

Icom America Wins Large U.S. Army Order for New Radios

F43G Series Offers U.S. Army Soldiers Sophisticated Two-Way Radios

Bellevue, WA - The U.S. Army has selected the Icom F43G series portable
transceiver for in-the-field soldier communications. "We are honored by the

U.S. Army's selection of Icom's two-way radios for soldiers in the field," says Hiro Nakaoka, President of Icom America Inc.

The Icom F43G radios are part of a package known collectively as the Military Bundle. Other elements of the Bundle include a headset, an encryption module, and the accessories needed to complete the custom package. But it's the F43G radios that are the core of the Bundle. These radios were tested extensively by the Army's Battle Lab before a purchase recommendation was made.

The GSA purchase deal is for over 20,000 Bundles and represents the largest government order in Icom America's 25 year history. This order follows on the heels of an earlier, high profile U.S Army order from Icom America - the Soldier Intercom. The new order uses Icom's new, next generation F43G series portable radios. These radios offer more power for today's urban-patrolling soldiers. The extra power helps radio signals "wiggle" around buildings, vehicles and other obstacles.

"We have over 5 years of experience supplying radios to first line Army units," said Chris Lougee, Vice President for Icom America. "The Icom Soldier Intercom was the first use of two-way radios at the squad level. It proved the viability of radios to replace hand and arm signals for coordinating squad actions on an objective." These new models increase transmission security, reduce size and weight, and supply improved battery performance, he added.

The largest previous government order was in 2000, for the U.S. Army's Soldier Intercom portable radio. This new radio differs from the Soldier Intercom in numerous ways. The previous Soldier Intercom was ordered by the Army with specifications for lowering the power level to 1/10th of a single watt.

Icom America's parent company, Icom Inc., was founded in Osaka, Japan. Icom is a publicly held Japanese corporation; its stock is traded on the Osaka and Tokyo Stock Exchange. Icom began as an engineering and manufacturing company, making advanced, compact solid-state radio equipment for use by amateur radio enthusiasts. Icom has since grown to become an industry leader with a product line that includes state-of-the-art communications equipment for land mobile and marine use as well as avionics. Icom America's headquarters are in Bellevue, Washington.

Wide frequency range and large channel capacity
The IC-F43G series covers a wide frequency range in one version (Two versions available, 400-470MHz or 450-512 (520) MHz). The 256 memory channel

capacity with 16 memory banks allows you to divide and store a variety of ?exible channel groupings. Easy memory channel selection with a simple rotation of the rotary channel knob.

Small and lightweight body
The IC-F43G series sheds size and weight compared with previous models, weighing just 300g (including BP-231) and measuring only 53(W)×120(H)×32.5(D) mm*. The aluminum die-cast chassis and polycarbonate casing combination meets MIL standard speci?cations.
* 10.6 oz, 23/32(W)x 423/32(H)x19/32(D)

1806. Kenwood TM-732A Pilot Lamps

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-10 21:28:43 UTC
From: Dick <LeadWinger>
Message-ID: <k76j51tkir1f942fhm027hvk921ru7hok7@4ax.com>
Source record: 16079

This seems to be my month for pilot lamps going out. Does anyone have a service manual on the Kenwood TM-732A? I need to know what kind of lamps are used at PL1, PL2, PL3 and PL4. They are used to illuminate the LCD display. They are incandescent, and appear to be similar to the 12V, 7219 lamps like my Icom uses. However, they are wired in series as pairs with a 10-ohm resistor in line with each pair. That would lead me to believe that they are not 12V.

I have talked from Tigard to east Portland on a stock AM CB with no
problems. I cannot make the same trip with 2m rig (even a 75 watt setup and
a 5/8 antenna) because of intervening terrain. QRP HF does have it's
benefits.

Not sure what the transmitter is - is it a kit you put together or was it a 'black box' you just connect up and play with? Does it buzz with no input? Or with just, say, a battery-powered transistor radio hooked up to the input? How hard are you driving it - are you possibly over-driving the input?

Frankly, it's over-kill to the extent of probably being illegal, but what the heck, you're not near me. But if it wasn't a kit, take it back and make them make it work.

Cheers.

Ken

If you did, one of you had a fixed antenna, like a beam or quad. Or one of you was on a hill. Did you have exactly the same conditions on both ends? Same locations, similar antennas, etc.? I.E. if there was a beam on one end for CB, was there a similar gain beam on 2-meters? I have used CB from all kinds of vehicles since it was originally authorized, and 2-meters since it had commercially available equipment (over 50 years) and I have never seen a situation where an unmodified CB could under similar conditions outdo 2-meters. Unless we are talking about skip of course, and there would be no skip between Tigard and Phoenix. Typically, you are lucky if you can get 5 miles mobile to mobile with stock CB's.

Source record: 16084
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.policy

A ham friend told me that he heard that DSPs really work at least a little bit. He doesn't have one and neither do I (although many of the newer and more expensive rigs have them, and there are one or two outboard DSPs that are available that can be added to older rigs in some ways). I don't know all that they can do (auto null heterodynes? auto noise reduction [what kind of noise reduction?]? audio enhancement [or audio bandpass shaping] of some kind?) but if static crashes can be really removed or attenuated, that would be of use to me. Auto null of heterodynes would be nice on those occassions when tuner-uppers decide to tune up on my frequency in which I am already in two way contact with others (on ssb phone). And, maybe there are some other useful characteristics I don't know about. But, are these really effective? For example, a 20 db heterodyne null is not much. Nulls have to be about 50-60 db to be useful.

I'll take any kind of comments, suggestions, refernces to testing, or personal experience, pro & con recomendations, ...anything...

There are some good demos at
http://www.radio.bhinstrumentation.co.uk/html/demonstration.html . I have a
cheap Radio Shack DSP40 that performs at the lower end of the scale as far
as these go. It does a remarkable job of multiple heterodyne reduction and
selectable audio passband but its noise blanker is next to useless and it
does not do noise reduction other than through selectivity.

The performance of a DSP is very dependant on the software it runs
under.

If they didn't work, none of the current military radio systems would be any
use - they all use DSP! I've designed an audio processing DSP system using
one of the new dsPIC devices and a codec - just two small chips. The codec
includes a mic pre-amp and headphone amp.

I've not had a lot of opportunity to use DSP for Amateur
applications, however I have used it in the Icom IC-718 for Civil Air
Patrol applications.

Several of CAP's 4mHz frequencies suffer from foreign hetrodynes
and other ectopics. The DSP has been over 90% effective in making the
channel "usable".

Hello all,

I got a RACAL MA.295 antenna change-over switch I would like to use.
It has on the front 3 N connectors labeled "antenna", "receiver" and
"transmitter" and a fuse holder plus 2 lamps (power on and transmit).
Inside is a transformer plus some diodes, a relay and a big coaxial
relay.
I do not want to rip up the wiring, so I was wondering if somebody
happens to have documentation of this thing.

Of course they work. How well, as Michael points out, depends on the
software.

> are available that can be added to older rigs in some ways). I don't know
> all that they can do (auto null heterodynes? auto noise reduction [what

DSPs can be programmed to do almost anything, but in amateur radios, they
generally are used to reduce noise and null hetrodynes.

> of some kind?) but if static crashes can be really removed or attenuated,

In general, the point of DSPs tends not to be to remove static crashes.
Some of the newer noise blankers are, in fact, processors that might be hard
to distinguish from DSPs. They tend to do a very good job on pulse noise,
but I haven't tripped across any that are even decent on static crashes.

> really effective? For example, a 20 db heterodyne null is not much. Nulls
> have to be about 50-60 db to be useful.

Remember, these things are software rather than filters. The stronger the
heterodyne, the easier it is for the software to recognize it.
Unfortunately, it's not magic. A really strong heterodyne is going to be
driving your AGC and perhaps overloading some amps in your chain, so it
isn't like it magically disappears with no other effect. Still, very often
the DSP can make life more pleasant in the presence of lids.

==========

They are Radio Frequency CHOKE coils. (RFC)

They are required to have a fairly high impedance, like 10,000 or
20,000 ohms, at the lowest frequency of interest and over the widest
range of frequencies as possible.

For the 160m or 80m bands, 1 or 2 milli-Henrys will do.

For the 10m band about 100 uH will suffice.

But values are VERY non-critical,

They should be wound with several fairly close together, but not
touching, banks of turns. This is to minimise self-capacitance across
the coil and reduce the probability of unwanted resonance at much
higher frequencies.

Go to the Kenwood web site and look for the amateur radio
service bulletins. The first two entries describe memory loss
problems for the TM-231A. Basically the power on reset
circuit fails and does a partial reset on power on. I have a
TM-331A and a TM-431A that have this problem. I haven't
tried to do the repair yet. I also have a 741 that is starting to
act up but it's not really bad yet. The 741 is the same vintage
as the 231 and probably has a similar circuit. I would also
make sure the pins that connect the band modules to the
main chassis are clean and not bent. The 4 wire cable that
connects the control panel to the chassis also should be
checked for good connections.

Source record: 16093

I've been looking around for a 70 cm band amplifier kit (to give my HT a little more power), but can't find one. And it seems that Mirage (MFJ) is the only company that even sells a 440 amplifier nowadays.

I found a few older 440 amps on eBay, but I'd kind of like to build it myself.

Does anyone know a source for a 440 amplifier kit?

Thanks for your help.

I have a couple newer micro-p controlled rigs that act the same way. PIA
compared to older rigs. Simplest solution is to hardwire the mobile to the
battery and *always* turn it off while starting the motor.

Jeff, don't know how silimar to my FT60 your VX150 is, but charging time
for my similar Yaesu radio is 10 hours.

A rule of thumb for your question above, recommended normal charge for
a NiCd battery is 110%. I don't know if that wall charger of yours
charges the battery at a 500mA rate, or if that is just the maximum current
capability of the wall unit. Maybe someone else here can help?

It is with great misgivings that I am about to sell my
precious tower.

I am moving and also getting older and not going to put up
the tower at he new location.

I have a Telex 55 foot, fold-over, MOTORIZED,
self-supporting tower that is in excellent shape. This is a
SERIOUSLY HEAVY-DUTY TOWER.

This has a commercially built rotor control box that
controls a prop pitch motor that would turn a tank. The
prop-pitch motor is included and already mounted. For a few
bucks more, I will include the t-6061 mast and even a
fiberglass cross-mast.

This jewel is in my backyard and is currently up.

After I take it down, it will be ready to put up and get on
the air. I have everything with it including the in-shack
control box (HAM_M).

I NEED TO DETERMINE if anyone is seriously interested in
this because I have other things that I need to do rather
than take down a tower that there is not a serious prospect
for.

The tower is in Houston, Texas but is well worth a drive to
Texas

I am expecting to offer this for around $2500.00 FIRM.

Thanks

Don't have the formula handy, but my VX-150 is happy with 8-10 hours
for a full charge on the original battery using the Yaesu charger made
for it.

Happy trails,

To be certain, you'd have to actually measure the rate at which the
charger is delivering current. It may be less than 500 mA - that may
be the "nearly short-circuited load" safety current rating rather than
the actual rate of delivery. You could measure this with a
milliammeter and a bit of care, I think.

You can figure that NiCd batteries, if fully discharged, are going to
require a total charge delivery which exceeds their rated capacity by
some amount - the charging process is not 100% efficient. A fairly
common slow-charge regime is a rate of C/10 (that is, one tenth of the
rated capacity), delivered for a period of around 14 hours. In the
case of your radio that would be 70 mA for 14 hours.

If the charger is actually delivering a higher current, you'd divide
that into the 700 mAh capacity to figure the number of hours required
for a 100% charge delivery (e.g. 2 hours at 350 mA), and then add a
finagle factor of maybe 30-40% to compensate for the inherent
inefficiency of the charging process.

A good fast-charger will have a "smart" charge cutoff circuit - it'll
detect the state of full charge (the battery heats up and its terminal
voltage starts to decrease a bit) and turn off the current or switch
to a low trickle-charge rate.

Naturally, if you're starting with a battery which is not fully
discharged, it will take less time to "top it up" than it would
require for a full charge.

The best two bits of advice I can give you, with regard to NiCd
batteries, is:

- Don't run them down *all* of the way. When they start to fade
out - at the first sign that the "battery monster" is chewing down
on your radio's ability to transmit or receive - turn the radio off
and/or switch to another battery pack. Running down a NiCd battery
all the way to zerch is likely to reverse-charge at least one of the
cells and damage it. When the voltage drops to 1 volt per cell
(6 volts in the case of your FNB-64 pack) there's very little
power left in it... unplug and recharge!

- Don't let them toast away on a charger (even a trickle charger) for days at a time. Recharge them properly and then unplug the radio from the charger.

Thanks. Interesting site. Somewhat surprised at the price of the
lamps. $3.57 each. They look very similar to the ones I purchased
from Mouser for 29-cents for my Icom. Must be something special about
them. Or maybe it's just because it comes from Kenwood.

It's been awhile, but on the highway, I seem to recall about 3, 4,
maybe 5 miles, max, with my old Rat-shack 5-watt AM CB rig, on flat
mid-Texas plains.

When I tune the local simplex frequency on 2-meter FM, I hear guys all
over a city of a million folks talking with decent strength.

I just bought an Icom PW-1 solid state kilowatt amplifier.
On my tower, I have an HF multiband antenna that is rated for 1200W, but 8' above it on the top of the same mast is my triband (2m/70cm/23cm) vertical.

My question (being new to the kilowatt club) is what proximity concerns might I have? I have a 2nd roof mounted mast about 30' away from the beam with a discone and a 6m-70cm log antenna on it.

To put it simply, is there a minimum distance I should keep other antennas away from the main HF array? I would prefer to not burn out the front end of any of my other radios.

Any experiences or advice on this one?

Thanks,
Pat, VE3PMK

Well see, now.. that's the problem.. y'all are flatlanders. :)

Yes, most any amount of power on VHF will go for astounding distances (I've talked with 4 watts from Salem to a repeater on the WA side of the Columbia River, about 60 miles distant) over flat land or to a high point. Problem is, Oregon doesn't have a lot of flat land, especially the Portland area. Hell, we have an extinct volcano right there in town, plus several other

hills, including the west hills between Portland and Tigard (about 14 miles). To talk simplex with my friend over in Tigard on 2m, I had to use a beam and bounce my signal off a commercial radio tower on top of Healey Heights.

I don't believe anyone would seriously recommend acid core solder for
electronics work- a sure fire way to ruin your equipment. 60/40 rosin core
has been the industry standard for as long as I can remember.

If the other antenae are directly above your HF vertical you should have no problems. The radiation pattern is a toroid (donut) shape and antennae above and below are in the 'hole'. I use a 6m/2m/70cm vertical above a pair of 40/75m inverted 'Vs' driven by 600 watts and haven't smoked anything yet. However RF is magic and YMMV.

Acid core solder will eat your electronics - save it for patching metal buckets or something. Use rosin core solder for electronics.

the 50/50 refers to the lead/tin ratio.

> At 850 F makes good solid

Boy, I wonder how long his equipment worked ???

Rosin core solder for electronics, even a real CB'er would know that.
Stay away from that cold heat pen, it is not good for electronics.

Hi with the GP300 by motorola, is there anyway of obtaining a line that would change its' state when the squelch was broken, giving a PIC processor an indication of state, ie if there is no traffic on the frequ then transmit data ?

Is there any such indicator that can be sourced from the PL / CTCSS chip etc. Providing that CTCSS was used.

HELP !!!

My HF antenna is a Beam, not a vertical.
Sorry, I should have better articulated that.

The 6 band HF beam is 1' above the thrust bearing, and ~ 8' above the beam is the triband vertical (at the very top of the mast.)
That said, there will definitely be a significant RF field above and below the beam, as well as to the obvious front and back of the beam.

So, is there a danger of inducing destructive voltages to the vertical above? What about other antennas on my roof near the tower?

My beam is well above the roof line, but as I have two tripods on the roof, each with assorted verticals and beams {6m - 70cm LogP, two discones, a 902 yagi, and 902 vertical, and a 220MHz vertical.) These are each 25 to 30 feet away from the HF beam. There's also a distorted G5RV (aka: has a 90 degree turn near the end of the long leg as to stay on the property) running off the roof to some trees along the back fence.

So you see my concern about having a 1KW RF source in proximity to all the other antennas.

> Have you ever wondered how some ruully, rully, big RF tubes would work
> as audio amplifiers? Like maybe a 3-500Z?

Many of the Eimac power triodes and tetrodes are rated for use at AF.

The 3CX400A7/8874 is a compact high-mu power triode
intended for use in zero bias Class B amplifiers in
audio or RF applications. Operation with zero bias
simplifies circuitry and cathode driven operation is
attractive since a power gain as high as twenty can be
obtained.

The 5CX1500A is designed for use as a Class AB1 linear
amplifier in audio or radio frequency applications. Its
characteristic low intermodulation distortion makes it
especially suitable for single sideband service. The
tube is also recommended for use as a Class C RF power
amplifier in CW, FM and AM service.

The 5CX1500A is good for 3200 Watts as a class AB1 audio power amp:

MAXIMUM RATINGS TYPICAL OPERATION
Class Type of Service Plate Voltage (Volts) Plate current (Amps) Plate Voltage (Volts) Screen Voltage (Volts) Plate Current (Amps) Drive Power (Watts) Output Power (kiloWatts)
AB1 AF Amplifier or Modulated 4,000 1.0 3,800 500 1.3 -- 3.22

A look through the catalog at <http://www.cpii.com/eimac/index.html>
is very instructive.

Isn't the effectiveness of DSP critically dependent upon the A/D converter;
its dynamic range, it's number of bits and it's sampling speed?

Re: Peter's comment below; I don't know enough about DSPs to answer. I got a few ideas and notions from all that responded. Me? I was most interested to learn whether any DSPs could do noise reduction of any kind. Heterodyne from lid tuner-uppers would be nice, too, and so would passband width and position.

I did google "DSP & ham radio" and quite a bit came up and it will take me some time to check out enough to figure out if it might be worth chucking out $200+ on a decent outboard unit (I can't justify laying out a big chunk of money on a really modern xcvr with built in DSP just for those relatively rare moments when I have pulse noise, hash noise, or a heterodyne, or someone with spillover from an adjacent frequency), so I need something that works pretty good. One guy said there is no "magic" meaning to me that maybe I should not expect rabbits to come out of hats easily and quickly. My friend with whom I have weekly ragchew ssb QSOs told me that just putting on headphones helped him read me when I was weak and his noise level was high. Also, it helped him a lot when I bought a linear and went from barefoot to four 811As. But, if a nearby QSO starts and thier audio is broad, the spillover can be annoying if they are stronger. Thus, if I could "DSP" a narrower passband and shift the frequency (or at least shift the "knee"), that might be useful.

Regarding efficacy, I remember back some 3-4 decades ago they were coming out with audio compandors that "compressed" 2.5+ khz of audio bandwidth into a signal about 1.2 khz wide, thus saving bandwidth but the gadgets never caught on bigtime and some gossip said that the extra "audio punch" and thus power boost (3 db-ish) really didn't end up doing that much. So, that is one example of a fancy-schmantzy gadget that didn't last long. This new PSK-31 audio jazz is also out there (the box is about $500 ?) and you need one at both ends of the voice QSO and I have not yet heard many of them (the review said that if the signal drops too low, the voice info just stops coming through the speaker, so it has its caveats, too).

Again, thanks to all those who made comments.

Pat:

It's a horrible problem, and there's nothing you can really do about it except put it back in the box and ship it to me in Hawaii. That'll put it far enough away you won't have to worry about cooking any of the other front ends....

hi hi hi....

On a serious note, you probably don't have much to worry about due to the difference of frequencies between various rigs. I have two HF rigs in my shack (Icom 751A and 746Pro) and with one on the X9 Beam and the other on the Carolina Windom (that uses the tower for support of one end) I do get some significant bleed through, but not enough energy to cause damage to either one.

If you typically work on a single band, you can put band traps (coax stubs cut to block a given band) on the radios you are worried about... Another choice is to make up a good antenna switch center that grounds the inputs to other (hf at least) rigs when you are pushing 1KW on HF. I'm working through the control logic for one right now... Want to be able to switch any of 5 antennas into choice of the two radios, with ground blanking for the receiving rig when transmitting on the other. The logic to do the grounding is trivial, but am still thinking about how I'm going to guarantee I don't get two rigs on the same antenna, and ground all unused antennas. 746 Pro will have priority if both rigs select the same antenna, and want to put other rig into dummy load if antenna selection conflict exists... Once I get past doing my income taxes, I'll actually start thinking about how to implement the logic.

Good Luck!

Message-ID: <425cfedf$1_4@newsfeed.slurp.net>
Source record: 16042

You should use the 200V 3 amp diodes. Any voltage/current rating diode that meets or exceeds the original spec and fits the available space will work. You should also consider buying parts at Mouser, where you'll find them at a fraction of the cost of the RS parts. There's no minimum order and the shipping cost is easily covered by the savings if you're buying several parts at one time.

I have for sale in excellent condition an Icom IC-471A all mode UHF transceiver.It comes with the mic & manual.Also included is the optional UT-15 tone encoder/CTCSS unit.The frequency range is from 430.0 to 450.0 MHz all mode.I also have the optional IC-PS25 internal power supply,I will include it free as it needs repair.The rig has never been used in a smoking environment.This is a great rig for general or satellite use.
I am asking $350.00 shipped to any lower 48 address.

Regards
Bob N4KTS

>Yes, and the AGC system that makes maximum use of the A/D and D/A range.
>See for example the organization of the Ten Tec Orion.

If the DSP system really needs some kind of AGC, then it is a useless
toy :-).

If you have a strong and a weak signal in the ADC input bandwidth and
the system gain depends on the strong signal, then the weak signal is
going to be drowned into the (quantisation)noise whenever the
amplitude of the strong signal is increased.

Any properly working DSP system should be designed in a way that it is
capable of properly converting the thermal noise as well as the
combination of all strong signals in the input.

The only justification for using AGC in front of a DSP system is that
if antennas with dramatically different efficiencies are used. For
instance, if the receiver input is switched between a full sized
dipole on 160 m and a ferrite rod (with perhaps -40 dB gain), then it
is quite acceptable to modify the gain with some kind of AGC, but this
could be handled as well with some antenna specific gain presets.

If the system is working an hour on a specific band with a specific
antenna, you should not need any kind of AGC depending on the actual
signal level. If you need AGC for this, then you are going to have
problems, if you are trying to receive any weak signal close to a
strong signal.

What one really needs are ADCs with many bits, say 24 bits,
sampled at least twice the highest signal frequency to be digitized.
One has to avoid saturation (overflow) else the rest of the
signal gets blanked during the overflows.

For noncritical applications you can go to any higher voltage diode , even
up to 1000 or 1.5 K volt diodes. The current rating is about the same .
You can find some 3 amp diodes that are about the same size as the 1 amp
diodes. YOu can go up to almost any reasonable amp rating on the diodes.

You may look on Ebay for some of the diodes.

1880. R390 For sale in NJ

I have a R390 for sale. Unit works fine..
Has Both meters.
Cosmetically good.
only thing is that it has a r390a data tag on it.
selling to replace in rack unit with a matching 390a. see pic on website
link below
the r390 is the lighter gray unit.

http://mysite.verizon.net/vzeeiuy2/id15.html

$500
I will not ship.
Located in NJ
I plan on being at the Warminster show in PA on the 1st of May.

The LSB should be less than the band or thermal noise in the _input_ bandwidth, so that it would act as dithering noise. For terrestrial VHF/UHF/SHF systems, the antenna temperature is close to 300 K and thus a noise density of -174 dBm/Hz. Assuming 10 kHz ADC input bandwidth, the equivalent noise power would be -134 dBm. In order to be able to correctly convert a strong signal _and_ the broad band noise riding on it correctly, the maximum signal level at the antenna for 16, 20 and 24 bits would be -38 dBm, -14 dBm resp. +10 dBm or assuming 50 ohm antenna impedance 2.7 mV, 44 mV resp. 710 mV. Not very common values on VHF/UHF.

At HF, the band noise is typically at least 20 dB stronger, so the gain in front of the ADC can be reduced and thus the maximum antenna voltage would be at least 10 times larger, so even the 16 bit converter would tolerate a single S9+55 dB signal.

However, in order to be able recover weak narrow band that would be buried in the 10 kHz broadband noise, quite good linearity is required for the dithering process. The dithering noise properties are also critical, e.g. if it contains mostly impulse noise instead of white thermal noise. You may have to move the ADC LSB deeper into the noise floor, which would reduce the maximum input voltage allowed or require more bits.

>> One has to avoid saturation (overflow) else the rest of the

>floating point numbers "on the fly" by using triple or even quadruple
>banks of digitizers, all contained in a small amount of chip real
>estate, and all controlled by a small microprocessor.

The exponent is just the gain in front of the ADC and the mantissa is the real converted data bits. If the exponent bits varies constantly, this just reflects the "AGC" control voltage of the preamplifier. The number of mantissa bits is the critical thing for a radio receiver. The mantissa bits must still be able to represent the broadband noise riding on strong signals. In practical terms, the exponent could only be used to reflect the broadband noise and antenna gain on a particular band and remain constant as long as the receiver is on that band.

Of course, if we could get a true IEEE float data type ADC with 24 significant bits in the mantissa and nearly 1500 dB dynamic range, there would not be much problems in data conversions :-).

While the use of floating point formats greatly simplifies range problems associated with multiplications and divisions, it still does not do any good for additions and subtractions, so you still have to watch for repeated additions of very small values to a large value and possibly regroup the repeated small number additions.

Most of the folks doing FP (for radar work, for instance) use a pair
of converters and successive-approximation logic to do scaling.

I'm also going to point out here that there are two different kinds of
DSP systems being discussed here.

First of all there are audio processors, which take the demodulated audio
from the receiver, digitize it, and process it. This is what the original
poster is talking about, and these gadgets work pretty well to deal with
heterodyne whistles. Some of them also work pretty well on impulse noise,
at least better than the noise limiter on an R-390. There is a wide
variety of them on the market, each of which has an audio-speed D/A and
A/D pair. The dynamic range required really isn't very high since the
AGC of the receiver has done all the hard part for you. 16-bit converters
are cheap and plentiful and more than enough. For the most part, though,
these devices are noise reduction units and can't do much about improving
receiver selectivity or reducing passband group delay.

SECONDLY, and a totally different animal, there are DSP systems that
directly digitize the receiver IF, and do IF filtration and demodulation
in the digital domain. They may _also_ do some audio processing, but
the big deal with these is that they now have very sharp IF filters
without substantial ringing, and they have extremely good demodulation
without a lot of group delay problems in general. These systems require
much wider input dynamic range, which is usually accomplished with
prescaling. These can be found built into the latest generation of
communications receiver, although folks like Watkins-Johnson also make
retrofit units that you could hang off your old Hallicrafters if you
don't mind paying a few hundred times what the radio costs.

Actually, you DID cross-post - albeit inadvertantly. Your latest post went to:

alt.radio.scanner.uk, aus.radio.amateur.misc, rec.radio.amateur.boatanchors, rec.radio.amateur.equipment, uk.radio.amateur

It's the automatic "reply to" action of Outlook Express (which I use) and possibly other mailers. I read it on aus.radio.amateur.misc.

As I say, inadvertant. The deliberate (targetted) cross-post was by the person that began the thread.

Did I personally find your humour offensive? Not particularly. But I always keep in mind the potential audience - particularly WRT age - so I certainly think it was inappropriate in forums of this type.

Unfortuntaely - worst sin - I didn't find your humour humourous. :-(

i hate to dissapoint you but currently i dont even have one concentric knob,let alone two

if one cant find concentric knobs,seek advice from your doctor or maybe a plastic surgeon can fursnish you with a concentric knob.

my one knob,is precoious to me,its the only thing that will stir my morning coffee in which i drink from a large pint size mug

i wish you luck

regards,Paul

Hello,

There's always one to lower the standards of the newsgroup (and crosspost) by giving such a pointless reply to a request for help. Grow up, I doubt anyone found it funny. Please have some respect for others before sending such messages.

thats strange how it cross piosted normally it says"you are not a member of
these groups" and then only sends to the one i am a mmember of,i have not
changrd anything so a bit weird

again though what age its a simole play on words,like the UK Carry on films

i find people and kids wearing FCUK clothes and the music kids listen too
and girls wearing trousers with there bums and knickers hanging out
offiensive sadly we dont do anything about such vulgarity.

so i doubt if many youngsters would find it offensive

if they do then tough shit anyone finds it offesnsive well thats there
problems not mine,i do in thisd world as i want and no one tells me how to
behave or what to do,that i find extremely offensive i am a free spirit i am
not bound by rules and regluations that do not cause real harm.

the things i mentioned cause real hamr and have added to the large moral
decay,my little bit of sacrcasms and wit and double entendre to a target
audience is of little consequnece

Hi,
I need the concentric knob pair for an Eddystone 990R - the original light
grey type with brushed aluminium end insert. This pair is the RF/IF gain control knobs.

Have tried Dave Simmons in the UK, but no response to requests.
Also have placed ad in the Eddystone User Group newsletter, no results.

Please remove NOSPAM in return email address
JEFF

Wonderful attitude I'm sure!

Actually, people tell you how to behave all the time, and I'm sure you obey - otherwise you would not have your liberty.

It's called society.

I will now up the ante. I do not like this kind of behaviour on public groups. Go out into the street instead and start yelling out your so-called humour and see how people take it. (It is a very similar concept, after all.)

Try having some regard for the other people around - whether using voice, or writing messages. If you don't like this, then expect to find yourself on people's ignore lists.

society stinks anyway
i have little to do with society,people woth aspergers syndrome live in
there own world,whixh is what the word autism means.

i make no apologies for that,i dont and never will accept anyone io consider
to be beneath me telling me what to do

if you dont like it tough luck

its perfectly ok behaviour one has the right as long as its not personal
insults

go out into streetr

ok people wearing FCUK cltohes

people watchiong bib brither/poeople drinking/people smoking/people taking
drugs/girls wearing clothes that hardly cover there boides,going to pubs
anbd clubs underage,the filth is out there.

all i said was on joke now remember you do not own Usenet if you dont like
it,then diont dare tell me what to do

you will come off worse i assure you,imean in terms of mails as any reply
you give i reply back
]

ignore by all means as then i wont reply to your stupid comments will i as
you wont be seeing my reply

so put me on ignore list,very childish of you but go for it

Keep trying,

Obviously you can't write anything relevant, but maybe you will eventually
write something in English.

1909. Testing config & AGC???

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-16 01:30:08 UTC
From: Ken Bessler <kg0wx@NOSPAMyahoo.com>
Message-ID: <BUZ7e.1584$mS1.1381@okepread04>
Source record: 15982

I'm trying to evaluate incoming signal strength
using my soundcard and a program called
"Cool Edit Pro 2.1". This rather sophisticated
package allows measurments down to 0.001
db.

I was wondering should I turn off my AGC on
my FT-857D for these measurements?

I take 10 readings within 1 second then switch
antennas and repeat. I average out the readings
and then decide which antenna is best for that
signal. I also look at background noise levels as
a reference.

Got a question for anyone with all-mode VHF-UHF experience. I want some input on the several rigs available for this. Yaesu FT-847, 897, 857, Icom 706, 910, etc. Any pros and cons on these radios, or suggestions?? I'm planning on getting something for SSB in the VHF-UHF spectrum, and don't know a lot about it up there. Thanks for your help.

Bill

1924. ICOM 751 problems

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-16 14:35:56 UTC
From: mikea@mikea.ath.cx
Message-ID: <d3r7sc$1pm$1@puck.litech.org>
Source record: 15997

My Icom 751 (first model, not a 751A) suddenly developed a problem this morning: the green "RECEIVE" LED started flashing irregularly, with the receive audio dropping out when it was off. All controls have been checked and are in their normal operating positions, squelch pot is all the way CCW, and this is true in all modes. The "NARROW" LED comes on for RTTY and CW when I select it, but I have audio only while the green "RECEIVE" LED is on.

At first I thought it was just the receive side of the rig. Further scrutiny shows that while the "XMIT" LED comes on when I transmit, the dummy load sees nothing from the transmitter and I have no meter indication with the meter switch in the Ic or Po positions; Vc shows good voltage.

Looks like I have a sick rig. I hope it's simple and doesn't require unobtainium parts.

Ideas, anyone? I guess I'll tear into it with meter and scope later today, when I was planning to be using it instead. *sigh*

> Ideas, anyone? I guess I'll tear into it with meter and scope later
> today, when I was planning to be using it instead. *sigh*

One further note:

When I crank the RF gain back from its accustomed full-CW (max gain)
position, the "RECEIVE" LED comes back on solid and I get receive audio
again in all modes. Still no XMIT output, though, even though the "XMIT"
LED comes on.

I think I just might have a power supply problem, or something in the RX
pulling the PS down to where the TX decides it doesn't want to try, or
maybe something else.

"Through the ICOM 751 with scope and meter" time, I guess. At least I have
the factory schematics, full though they may be of teeny-tiny lettering and
ling, intertwining air-lines with stuff breaking out of them at odd places.
I sure hope the labels on those air-lines are good.

Any -- and I mean _ANY_ -- help, advice, and comments will be very most
welcome.

HI, check this also.
The FT-847 gives the most bang for your buck!!
For VHF UHF SSB work it is a wonderful radio!! The receiver is HOT!
Remember, it's a satellite radio, so it needs to be hot!
I have no problems on HF also.
The only problem I have (as many) is the volume control has sort of a
tick to it.
Instead of smooth operation (95% of the control is fine)
It goes sort of like this.....
0 = vol off 10 = full vol.
1.... 2.....3.....5..... 6..... 7.....8.....9.....10...
In other words it jumps from a 3 to a 5.
Not worth getting a tizzy about.
You can get a used 847 from about $750 - $1000 in good working order.

http://www.uksmg.org/ft847.htm

73 and good luck

I have the same rig Mike. Have'nt seen exactly your problem, but did
you ever replace your battery backed ram board. I did! I bought
it from Italy guy named Roberto Nardo. The ramboard is battery
backed with a lithium cell. If the battery sinks below a certain
level you have lost your entire operating system. With the one
I bought from Italy you wont loose the entire system if battery
dies, just the 30 memory chnls are lost. You can still carry on
normally from the freqcy dial on whatever freqs you want to use.

> i bought a nice kenwood vfo 230 and it smell's so strong of cigarette
> smoke it is sicking it is outside any good idea's how to get it
> smelling good agn thanks del k9fcm

I have a few spelling nitpicks before I suggest something.

'i bought' should have been 'I bought' (uppercase when referring
to yourself).

'kenwood' should also be uppercased as 'Kenwood' since it's being
used as a proper name.

"smell's" should be typed as 'smells,' and the same with 'ideas'
instead of "idea's."

Finally, you seem to have an aversion to the use of periods.

Now, with all that out of the way... A good way to get rid of
smoker stench is through the use of a citrus-based household cleaner,
such as that found in hardware stores.

There are a couple of caveats to use of the stuff. First, it will
eat some types of plastic for breakfast. If you're going to try it on
plastic, try a small amount on a small and inconspicuous area first.

Second: No matter what you use it on, it would be a Good Thing to
go over the surface(s) cleaned with a water-dampened cloth after hitting
it with the solvent. That should neutralize any potential for long-term
finish damage.

Happy cleaning.

Yes you must turn off the agc. Then the audio output will be linear
with respect to incoming signal strength. You will probably have to
adjust the rf gain to avoid overloading the receiver with the agc off.
Once a reference level is set then you can compare the two antennas
difference.

1939. S/N ratio question - have I got this right?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-17 22:30:17 UTC
From: Ken Bessler <kg0wx@NOSPAMyahoo.com>
Message-ID: <ZrB8e.2850$mS1.499@okepread04>
Source record: 15912
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

Someone check my math, please? I'm using
a program called "Cool Edit Pro" which can
give me very accurate readings of tone levels
coming from my FT-857D into my soundcard.

I'm trying to develop my own way of evaluating
my new vertical's (Cushcraft R7000) performance
compared to my dipole. I'm starting by tuning
700 hz off of WWV's 10 mhz carrier and recording
the tone I get in USB mode with my AGC off. I
switched antennas during the recording and took
2 samples:

1st example Cushcraft R7000
Noise @ 2k = -39.27db
Signal @ .7k = -7.26db
S/N difference = 32.01db
S/n Ratio = 14.662

2nd example 40m ladderline fed dipole
Noise @ 2k = -30.11db
Signal @ .7k = -8.864db
S/N difference = 21.246db
S/n Ratio = 10.622

For some reason my program gives me the back-
ground and signal levels in negative DB. I used
this formula to come up with a S/N ratio:

S/N = 20 log10(-dbs/-dbn)

Can someone check my math? My guess is
that my R7000 is better at WWV for this test.

CoolEdit always references with 0 as the maximum signal level; i.e.,
32768/-32767 are max for 16 bit recordings. This viewing mode is
selected with View -> Vertical Scale Format -> Sample Values. You may
also select Decibels, Normalized Values, etc.

I have CoolEdit 2000. Is yours a newer one since the company was bought
out?

When you did the level check, how was that done? Did you select Analyze -> Statistics and run it against a marked area in the recording for an average? If so, how long was the average? Did you run a filter first to isolate the signal from the "noise"? Or did you run the FFT function?

Signal to noise ratio is the difference between the signal and the noise.
i.e. In your
first example: -8.864-(-30.11) = 21.264 dB.

Not sure what you mean by quoting levels in "dB", since it must be
referenced to a
specific value. Assume it is "dBm".

A sky wave signal should be averaged of a long period to estimate the actual
signal level.
Also the RF gain must be backed off so the receiver is not saturating from
the input signal.

Your "20log10" is the expression used when calculating the dB ratio between
two voltages.
Assume you mean "Log to the base 10".

Hope this helps.

Sorry, I should have said 0dB, and then that samples are referenced to
